Agreed - I don't care for HF packet, but it's the only mode we have
which allows multiple users on the same frequency. However, it seems
to me that AX.25 has a weakness on HF not encountered as frequently on
VHF: it depends on all the users on frequency being able to hear each
other to work well, and that's anything but the case on HF, right?
Isn't this an inherent problem with packet on HF? Given 10 stations
around the U.S. picked at random, what are the chances that they'll
all be able to hear each other on 20m? So some stations are happy, and
others see lots and lots of collisions. It just doesn't seem to me
that the protocol is well suited for HF, much less the modems.

Howdy,

I am trying to hook up an AEA PK232MBX to my Icom W2A HT.

Where can I find a schematic for a cable to hook the two up?

I appreciate all the help you can supply,
Thanks,
Rod

Kory,

My MFJ1278B works very good in CW, RTTY, Pactor, and FAX modes. I have no complaints with the Data Controller at all.

The Multicom Software I bought is very bad. It is a DOS program that is unstable, crudely copy-protected and not supported by updates. IMHO, SSTV and image software should be purchased elsewhere for the MFJ Data Controller.

>Program can do THAT!!!!

Unfortunatly, it cannot switch to 5 bit Baudot at 45.45 bauds. :-((
If I understand well HamCom 3.0, it sould be possible to use an
external TU, with the version 3.0. Perhaps that could be a solution.
I will examine the docs of this software soon.

Thanks for your advice.

I am running a packet forwarding/bbs link in sw Ontario. Using FBB ver 5.15c and BPQ node stack software. The tnc's are new Kam 9612's. During transmitter keying the same frame of packets is send over and over again in the same keydown. This problem starts off with just a few extra frames being sent and then on the next tx. even more frames are sent so that eventually something like 10 or more frames are being transmitted . At this point the radio is transmitting for a minute or more. I have tried expermenting with the bpqcfg.txt pram. and remembering to compile the text file each time and also playing with the maxframe pram. in the port.sys file. Any ideas anyone?

An accurate description. I'd also add that the practice doesn't
involve just disabling some "billing feature" so that you don't
receive a bill, rather it involves electronically masquerading
as someone else - who could potentially have to pay for whatever
calls you make.

Alas, you are correct. Hidden terminals still remain the bane of
AX25. Karn's MACA protocol is much better. It has a method to
force others to hold off when a packet doesn't get through, IE
the receiver sends a NAK and every station which hears that backs
off one packet time, except the original sender. So even if other
stations can't hear the original sender, they stand by for the
receiving station if they're causing it interference, and those
paths should be reciprocal, so hidden terminals are quashed.
Add to that the strong and adaptive FEC in Karn's proposal, and
it looks like a winner. The only fly in the ointment is that
AX25 is embedded in the FCC rules. Maybe we could just rename
MACA to AX25 Version 3.0 and all would be well. :-)

Another thought of interest, especially to DSP gurus, is that
soft decision decoding works particularly well with certain forms
of FEC. Instead of having the modem do hard bit slicing, we'd like
it to report a bit quality. Supposing an 8 bit result code, a
hard '1' would be 255 while a hard '0' would be 0, but with a
soft decision decoder, we could assign to a '1' a value between
128 and 255, and conversely for '0' we'd assign a value between
0 and 127 according to the *confidence* we had in the symbol
being a 1 or 0. The FEC algorithm can then, when it detects an

error, first try changing the bits in which we have the least
confidence. This will speed up and improve the FEC algorithm's
action in most cases. And if we do "memory ARQ" we can combine
two or more copies of the same frame by summing their bit confidence
values. This should overcome more cases of error than just dealing
with hard slice values. Though if the confidence values are *radically*
different, we'd probably do better to do bit erasure instead, and let
the FEC replace the bit in the normal fashion through the redundant
information in the frames.

(Karn suggests using the output of an RF noise blanker as an erasure
signal in a hard sliced system. I suspect that a DSP hacker could
come up with a better way, or at least additional ways, of flagging
impulse noises and interfering carriers in the channel. When the FEC
has a good clue which bit is in error, its performance can be improved
markedly.)

: >it to work, works well, etc.
: >Dexter

Dexter: The FT-5100 has very poor transmit frequency
response which is not at all suitable. This response problem
exists with the data jack on the rear. It has poor low-frequency
coupling, and hthe high frequency roll-off is ~20 dB., rendering
it not usuable for 9600 baud packet. (ALso very poor for 300- and 1200-
baud packet as well).

The response roll-off is more than can be reasonably accomodated
with external equalization -- so you either have to modify the
FT-5100 (and I do not know if this is even possible), or
choose a different radio.

- Tom, N5EG

I know that JNOS runs under Windows NT, but I don't know about NOS.
Remember that under Windows NT, user mode software is not allowed
access to the hardware. That is one of the many parts that makes it
C2 compliant. Anyways, what NT will do in the case of DOS and Windows
3.1 apps is that it will trap references to the com port and re issue
them to the native mode drivers, based on access privs, ect. This
takes a bit of time in the case of DOS apps, since it is emulating
BIOS and DOS overhead. Well written WIndows 3.1 apps don't suffer
this, if they are written to use the Windows COMM driver, and not
bypass it. They are imediately "thunked" to native mode and sent.

JNOS seems to be a little better and behaving in its calls to BIOS. It
may be that plain old NOS is bypassing all that and trying to wack the
hardware, and Windows NT is getting preturbed at it. :-)

Just my two cents.

I assume you are referring to Phil's NET program. It has been mainly
superceded by his later program NOS, or one of the variations, JNOS and TNOS.
ftp.ucsd.edu has all of these (/hamradio/packet/tcpip/....)

JNOS seems to be the most popular variant at present. It has a lot of BBS
stuff included. The only version of NET (Intel processor, that is) still
being worked on (and it probably will not change much more) is the version
which k5jb did based on Phil's 890421.0, which can be found at ftp.tapr.org.

It would seem that Darren (or is that inmate James) thought "comp.sys.mac.programmer.codewarrior" (A board for Metrowerks Codewarrior, a Macintosh development environment) would be a good place to cross-post a query about reprogramming mobile phones. I guess it was the combination of 'programmer' and 'code'.

Just another useless observation of the day.

I understood what he meant -- a spread spectrum system operating at a low
enough data rate that the spread signal would fit into, say, a standard
SSB bandwidth while still giving significant processing gain.

A while back I was looking at m-ary FSK, which has many nice properties
for robust operation over HF. The Brits have used it for a long time in
their "Piccolo" modems.

Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.shortwave

I recently bought a cheap Macintosh Plus computer, and I am looking for some decoding software to run on it. I would like to decode some digital transmissions off of my shortwave radio. As for the type it doesn't matter- RTTY, ACARS, packet, fax, anything.

If anyone knows of or has some freeware/shareware that would do this, could they please mail me?

Thanks

3295. Ham Radio + X-10 Product offered

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-07-24 00:00:00 UTC
From: Marshall Craw <mcraw@halcyon.com>
Message-ID: <Pine.ULT.3.91.950724201308.29735D-100000@coho.halcyon.com>
Source record: 42332

I am pleased to announce an exciting new product, the RCS-I. This radio controller connects to any VHF/UHF radio and can control devices located through out a building using the X-10 powerline standard. X-10 modules are common, and offered by Leviton, Radio Shack, Sears and many others.

In addition, the RCS-I can monitor an alarm input, and attempt to contact you when an alarm event happens. The unit has a system message that can be played or recorded via radio, or the front panel. The RCS-I responds to all commands in a plesant female voice, and with your call sign, in your voice. There are too many features to describe here. Please look at our Web page at:

http://www.halcyon.com/pos.time.sys/top

or email a request for more information.
Thank You,

Marshall Craw

One of our guys is using the XV4 and their receive converter at his
home station. He didn't bother with TR, just uses two antennas. It's
not very robust, but it does work for him. He's about 3 air miles from
the nearest switch. If you've got to haul data 30 miles or more, or
deal with a high RF site, it's not going to hack it.

>Any advice on which one to buy would be greatly appreciated.

Well, first of all you don't need the GPS firmware in the TNC unless
you're going to run the TNC standalone with a GPS receiver. The APRS
package will talk to an ordinary TNC, and an ordinary GPS receiver
without any special firmware. PacComm also sells the HSP adaptor that
allows you to use an ordinary TNC and an ordinary GPS receiver on a
single comm port with APRS. PacComm also sells an integrated TNC and
GPS receiver all in one box. But you can make your own HSP adapter,
it's just 2 transistors, 3 diodes, and two resistors wired up between
a pair of back to back DB-9 connectors. A child could do it, maybe
you can find one to do it for you. Otherwise get out the magnifier
and tweezers. :-)

PacComm has been on my good list for a long time. However, Kantronics
has recently climbed back on my good list too. I've heard ill things
about the early AEA PK-12s, but perhaps they've straightened that out
by now. None of this is rocket science, even the MFJs work OK after
you scrape some paint and tighten some screws. (In fact before we
abandoned the TNC paradigm, we used MFJ TNCs on all our mountaintop
sites. After you rework them a bit, they work fine, and radiate less
hash than some of the others. Just goes to show a tin box is better
than plastic as an RF enclosure.)

There is SLIP in Windows 95. It needs to be installed. It may be in
the PlusPak, or if you are a beta user, look in \admin\apptools\slip
for the INF file. Go into the controll panel, select install software,
select the middle tab (Windows software), click "Have Disk", point it
to that directory, and check "Slip: Internet networking" and install
it. Go into dialup networking and define a slip connection.

Kantronics also makes an adapter cable for the HSP (Hardware Single Port) mode of APRS. This allows the TNC and GPS to be connected to one port on the computer. The major difference in the Kantronics cable from the others is that it provides TRUE RTS/CTS hardware flow control as well as all the APRS special features.

It hasn't shipped to the dealers, and has just come off the production floor - I know because I wrote the software required for factory testing today. (I also designed the interface for Kantronics HSP cable.)

To do what you are asking for, NET/Mac would have to support the MacTCP
API's which it does not. Sorry.

3305. Which better: KamPlus or MFJ1278B/DSP?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-07-25 00:00:00 UTC
From: hmm@netcom.com
Message-ID: <hmm-2507951754420001@192.0.2.1>
Source record: 42334

I want to get a multi mode controller, and so far, I am looking at either
the Kantronics KamPlus, or the MFJ-1278B - optionally the MFJ-1278B DSP.

The MFJ seems to have SSTV support, but the KamPlus seems to have G-TOR support.

Other than that, they seem to be pretty much the same.

I would probably get the MFJ since it has DSP, although im not sure how
important that is. Any info on this would be appriciated.

So, if someone could tell me if there are any other differences, and what
your opinion is on the two, and what mode you see would be more important
to not have - SSTV or G-TOR.

Any help is greatly appriciated.

Thanks in advance!

3307. Which TNC is best for APRS with GPS ??

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-07-25 00:00:00 UTC
From: gsanial@freenet.edmonton.ab.ca
Message-ID: <3v1fq1$4at@news.sas.ab.ca>
Source record: 42336

First, thanks for reading this message.

I want to run the APRS program on my laptop. I have been looking at AEA's PK-12, it has GPS firmware built-in and it is possible to buy an adapter to connect the GPS and TNC on the same port, since my laptop has only one port it seems pretty handy.
Kantronics and I believe PacCom also sell TNCs with GPS firmware in then although I have not heard of them having adapter cables for single port computers.

Any advice on which one to buy would be greatly appreciated.

Gilbert VE6GES.

Well NOS wasn't designed to be an appliance. It was intended to
teach you how TCP/IP works, even including source code so you can
dig inside.

Again banging the "it's not an appliance drum", let me say that
Linux is both a strong and stable OS platform, and fully open
for the education of the user. It's not intended for dim bulbs
who can only point and click, though you can make it emulate
an Etch-A-Sketch too if you start up X. Unlike Windoze, Linux
won't crash because an application went nuts, and unlike
Windoze 95.8, you can actually have more than 4 or 5 tasks
running at the same time, and they'll actually have some decent
performance, even on a non-supercharged machine.

Now on the subject of commercial apps, one might be tempted to
ask, "who needs'em". With Linux, most any of the thousands of apps
available for Unix will compile and run fine, and then there are
the hundreds of tools that come with the package, including industry
standard text processing and the industry standard C complier, no
I *don't* mean Microshlock C. There's little need for outside commercial
apps when the OS itself isn't a pitiful crippled thing.

And speaking of ease of configuration, ever try to back some commercial
apps *out* of Windoze? That's enough to make most users just want to
type "FORMAT C:". In fact, anybody doing development on a Windoze system
has probably typed that more than once as the brittle system screwed itself
royally when it crashed, and your only hope is to reach for the install
disks and start over. I won't even start on load order in config.sys and
autoexec.bat for all the conflicting and incompatible drivers.

There, now I feel better. :-)

Free - Latest Release of Macintosh TCP/IP software for Amateur Radio

version NET_Mac2.3.54

For those who don't know NET/Mac... NET/Mac is the application that
supports TCP/IP over packet-radio, which means, that hamradio operators
can use NET/Mac for their wireless TCP/IP network...

In this version of NET/Mac the following mods/features were implemented:

- 'netmacicons' now also defines the icontype of 'source'-files
- <hostname>.<domainname> is now the same as <hostname>
- Added a mailfile-size-limit to the popmail command
- Added command 'domainname'
- Some cosmetic mods for netmacicons
- NET/Mac does NOT support the new Buckmaster CD-ROM's HAMCALL
database yet... I am trying to convince Buckmaster that I need
the new data-encryption-method, but as of yet they are not ready
to release a description of the encoding-algorithm...
The old CD-ROM's remain fully supported...

This version obsoletes all versions of info-mac/comm/radio-net-mac in
the Sumex-Aim.stanford.edu (and it's mirror-) archives.

The new NET/Mac has (hopefully) been uploaded to:

- oak.oakland.edu, to the directory /pub/hamradio/mac/digital
- ftp.ucsd.edu, to directory /hamradio/packet/tcpip/incoming.
If it's not there (anymore), then look at /hamradio/packet/tcpip/mac.
- hamster.business.uwo.ca, to directory /pub/amsoft

NET/Mac includes interactive HELP if you are just starting out. I also include
a TCP.FAQ (Frequently Asked Questions) that even includes names and addresses
of regional gurus and a "by the numbers" list of what you do to get
operational.

Send me (1) one formatted disk and a *self addressed and *stamped disk mailer
marked TCP/IP... 800k or 1.4 Meg disks are OK but they MUST be formatted.

73,

Source record: 42202

Free, Fun, and Easier to Use Than Ever..."Macnet Roster"

"Macnet Roster" (ver. 678) has just been updated and is now a stand-alone application! The version number = the number of records.

You no longer need HyperCard to use this program - but it has virtually all of the same features and conveniences.

"Macnet Roster" lists:

o CALL SIGN @ HOME PBBS
o FULL NAME
o ADDRESS
o CITY, STATE, ZIP
o INTERNET ADDRESS
o MACS USED
o RADIOS USED
o SOFTWARE USED
o PASSIONS
o COMMENTS

of every known amateur radio operator in the world that uses a Mac computer.

You can use "Macnet Roster" to find other Mac users that you can then communicate with directly. Compare notes on software, applications, ideas, hints and kinks, and make new ham friends that use the same computer you do. (You already know how cool you are - imagine accessing "the rest of us"!)

If you'd like the latest "Macnet Roster":

Send me a formatted disk in a self addressed and stamped disk mailer that is in a large envelope clearly marked "ROSTER".

Put YOUR INFO (via EMAIL or disk using TEACH TEXT) if you'd like to be included in the "Macnet Roster" or send an update to your stats to me via pkt or email anytime.

73,

Sure, you can use AMTOR FEC mode to transmit packets, but it's the
lowest level mode that determines channel performance, so you still
have to operate non-contending, or AMTOR FEC will be confused by
other stations transmitting on the channel.

>where everyone can hear each other very well, I don't see a huge
>disimprovement switching a TNC out of 1/2 duplex to full duplex mode
>(param ax0 `whatever' from NOS).

There are *huge* differences as the network load increases. Since HF
won't have nearly the capacity of VHF networks, it'll approach saturation
on a given channel very quickly, so lack of good CSMA control will be
a critical weakness. Karn's MACA is better, because it allows the *receiving
station* to deal with "hidden terminals", and that solves the major problem
with AX25 where the hidden terminals have to be able to hear the transmitting
station in order to hold off properly, which they can't do by definition
since they are "hidden" with regard to the transmitting station but not
the receiving station.

>But are there protocol timing requirements that would complicate this?
>Like clocking in AMTOR?

AMTOR's ARQ mode has critical timing relationships, but FEC broadcast
mode doesn't. Nonetheless, channel contention isn't handled by AMTOR

at all. So you still can't have multiple pairs of stations using the
channel at once.

>: Sure, you could do that, but the channel still has to be non-contending.
>
>Is there anything on line describing GTOR anywhere?

Haven't seen it.

3318. KAM 8.0 Firmware - Does GMON Really Work?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-07-26 00:00:00 UTC
From: dritari@ibm.net
Message-ID: <3v5i4h$3ltk@news-s01.ny.us.ibm.net>
Source record: 42205

Just installed two KAM units (one with enhancement board...the other the KAM Plus) with the new 8.0 ROM which supports GPS and GTOR monitoring. The documentation for the GMON function is very poor. After another ham and I spent several hours now trying to actually monitor GTOR with no success, I thought I'd ask if anyone has actually been able to get this to work!? (we're not new to gtor but I'm wondering if Kantronics sold us an upgrade that hasn't been adequately tested/documented).

73s...Doug.

3319. Re: Which better: KamPlus or MFJ1278B/DSP?

>
>So, if someone could tell me if there are any other differences, and what
>your opinion is on the two, and what mode you see would be more important
>to not have - SSTV or G-TOR.

MFJ's 1278 is the only multimode that does SSTV properly, but that's
only important if you are interested in SSTV. But the host software
for the 1278, all modes, really bites, which negates most of its touted
advantages, unless you're up to rolling your own host software. OTOH,
the KAM is very popular, so GTOR is going to become a serious player
for HF digital (until it is displaced by something better like PACTOR II
or Clover), and there is reasonable host software for it too. The KAM
will also do VHF packet simultaneously with HF, which the MFJ, nor the
PK-232, can do. So the decision should be easy unless the lure of SSTV
is strong.

I won't touch on MFJ's reputation for poor QC here other than to say
that any amateur should be able to rectify any such problems at home
without much trouble. So unless you're completely non-technical, that
shouldn't be a serious objection, just something you should remember.

Let me throw yet another contender onto the stack, however, and
suggest you take a look at the new HAL P-38. It weighs in at around
the same cost as other multimode controllers, but does Clover as well
as RTTY, AMTOR, and PACTOR. (HAL is rumored to be willing to add GTOR
support to the P-38 too.) While Clover hasn't caught on rapidly due to
the high cost of the original Clover systems, the P-38 should change
this. There's no support for AX25 via Bell 103 included with the
package, but that's no great loss unless you're into APRS networking.

I would like to use a drsi card under os/2, however the THS-TNCTSR combination that works find under dos does not work reliably under Windows or OS/2. The multitasking code in THS is the culprit I think. I found a version of THS 4.30 I think that is compiled for OS/2 but it doesnt seem to support the pcpa adapter not can I find a version of tnctsr for OS/2. What other options are available to use this card under os/2. Any replies or suggestions will be greatly appreciated.

Regards, Terry KF9HI

Maybe... Arround where I am you can (if you sign up for the "right" 6+ month service package) get a cell phone for $0.01 (yes, one cent). Now, one of the thoughts that has crossed my mind is wouldn't it be great to get a few of these el-cheapo cell phones, re-program them and move them upto the 902-928 MHz band. In Canada you need to have an Advanced Qualification (which I have) in order to modify/use home modified transmitters, but that isn't a problem for me (or a large percentage of other Canadian hams) ...

Now, let's see, get one of these modified cell phones, add a repeater with an autopatch, and hey one is cooking. Ok, so the standard limitations of amateur radio are still in place (no business calls, etc.). Still, MOST of the goodies of a cell phone without the $$$.

So, yes, I would be interested in info. on reprogramming/changing frequencies on a cell phone (but ONLY for stuff that is within the letter of the law (and what I would argue is within the spirit of the law as well)).

I got 'Cloned' a couple months ago driving through New York City. I use my phone for mainly emergency reasons and only put about $5 a month on it. My provider flag the illegal use after two days and $200 in phone calls. It didnt cost me anything, but I had to get my phone reprogrammed with a new number and notify everybody with my number of my new number, It was a pain in the a!#$3#$. This guy called one number a bunch of times, I hope they nail him. If the Cell-phone companies could stop the cloning it could probably reduce my bill by %20.

You not only steal from the phone company and the person your cloning but also from every cell-phone user due to higher rates.

My 2 cents.

Jim Shelton

$0.01 eh? So the "right" 6+ month plan is free? Yea OK. Sure, I can
get a Motorola flip phone for free (not even $0.01) but I need to sign
an agreement for 6-12 months of service at a minimum of $30 / month or
something. Now, you're thinking of getting a few of these?

Also, a cell phone puts out what 1W? Bag phones around 3W? You're
going to set a receiver up at your house and expect to get how far?
Sounds more like an expensive cordless phone now to me.

We need some help setting up MSYS (ver 1.16) to use a serial port. We want
to connect the serial port to another computer to run a program on the
other computer remotely via packet. We have the computers connected now
but the
only way we've found to talk to the serial port (port 3) from the radio is
to connect to the KANODE and type C3 XXX. When we do that MSYS expects
there
to be a TNC on that port and sends KISS commands. Is there a way to define
that port as a dumb terminal port instead of a TNC port??? Would it help
to go to
a later version of MSYS???
HELP!!!

How about the Baycom modem? It's mostly software with a little unit
that connects to a serial port (I have one I used to use on a 386 desktop)

It worked pretty nice. Unfortunatly once one gets into 14.4k+ Internet
the 1.2k overcrowded packet feels like CRaaawwling...

>performance, even on a non-supercharged machine.

Hmmm... last time I checked, my desktop machine running Win95 was
doing everything I needed. My Linux machine, on the other hand, was
sitting idle with a blown-up file system, waiting for me to fix it.
My SPARCStation was humming right along, though it had suffred from
the same power failure and was--unlike the Linux box--actually doing
things to the file system at the time.

>Now on the subject of commercial apps, one might be tempted to
>ask, "who needs'em".

One MIGHT be, but I see you are smart enough to avoid saying such a
silly thing.

>I *don't* mean Microshlock C. There's little need for outside commercial
>apps when the OS itself isn't a pitiful crippled thing.

Can I get WinWord 6.0 for Linux (and please no discussions of Tex or
Emacs, there is NO comparison. WinWord is a spectacular tool that
doesn't require a lifetime dedication to learning.) How about Excel?
How about the hundreds of other slick, easy to use products that are
designed to run under Windows? Face reality--eunning applications may
be your hobby, I like to get work done.

>And speaking of ease of configuration, ever try to back some commercial
>apps *out* of Windoze? That's enough to make most users just want to

Even accepting the above--arguendo--so what? Linux is an order of
magnitude more difficult to configure! It is UNIX, silly person. It
requires an ENORMOUS amount of esoteric knowledge to use. It is fine
if you want ot use it as a hobby or maybe even as a server (get
Solaris!) but it is NOT competitive with Windows 95 on the desktop.

Hi All,

I was just wondering if anyone here has ever made a contact either on InterNet or Packet etc., with a guy who was travelling around the U.S. on a very elaborate and expensive ($1.5 Million) computer and ham radio equipped bicycle - powered only by peddles and a solar panel? I caught this guy in a segment on one of these techie type TV shows last night and was quite amazed. Some of his conveniences included: a global positioning system that stamped his out-going messages with his current position, specialized computer keyboard control from the hand grips of the bike, as well as mouse cursor control by moving the position of his helmet, and a "heads-up" display similar to those used by fighter pilots to view their displays as if floating in space in front of their helmets.
Very interesting indeed.

Yvonne

Yup, as one of the folks who did his share of dumping on Kantronics for having missed the boat with previous releases of the GTOR ROMs over this very problem of monitoring, this new announcement from them caught my eye, too. The order form got fed into the FAX machine that same day it arrived in the mail.

I'll be very interested to test it out as soon as it shows up and assuming that it does what one would expect, I'll certainly be delighted to reverse my previous position on GTOR.

>I would like to use a drsi card under os/2, however the THS-TNCTSR
>combination that works find under dos does not work reliably under
>Windows or OS/2.

There is no support for the DRSI PCPA card, except in DOS... However, I
have been very successful running THS v2.50 for DOS under Windows 3.1...
Load TNCTSR-S high before running Windows...

> The multitasking code in THS is the culprit I think. I
>found a version of THS 4.30 I think that is compiled for OS/2 but it
>doesnt seem to support the pcpa adapter not can I find a version of
>tnctsr for OS/2.

There is no support for the PCPA card under OS/2... If you like the
THS program as I do, then you have a few options... Get a TNC-2 or 100%
clone and get the WA8DED firmware for it... I ran THS with a TNC-2 and
WA8DED for a year with no trouble... Then you can run THS for OS/2...

Peter, HB9CVV, has version 6.10 (I think) out for OS/2... DOS and the PCPA
card are no longer supported... Sorry...

The DRSI PCPA is a nice card... See the current issue of 73 magazine for
the article about 19,200 baud packet with the PCPA Type 1 card and the AEA
DR4-10 digital radio... Too bad DRSI dropped the ham radio market...!!!

> >Unlike Windoze, Linux won't crash because an application went nuts,
>
>Never heard of a kernel panic, eh?

Sure I have. And I know the difference between a kernel panic and a
windoze crash. Don't you?

Just to make sure you know: a kernel panic is an orderly emergency
shutdown of the operating system when a consistency check has failed,
due either to a software or hardware error. It leaves the system in
a known and safe state, ready to be analyzed or restarted. Files have
been closed and caches flushed to disk. An image of the operating
system from the time of the failure is available for analysis by tools
that are provided with the system.

That is as opposed to the usual windoze crash, where the system simply
stops responding, and a hardware reset or power cycle is needed to start
over. Rarely is the system in exactly the same state as before, and
there is no opportunity to analyze the problem with a view towards
getting it corrected.

Do you understand the difference now? And why professional computer
users prefer the former?
- Brian

The KAM can only decode black and white.
They simply use the FSK modem output, so giving only 1 ore 0.
Try JVFAX, great programm and works with a very simple 'modem'
(Just an OpAmp)

Hi.
I writing my diploma thesis right now (it's about the theoretical
development of a PR network - protocols mainly)and I'll have to have a
section about the hardware as well. Unfortionately that's not my favorite
topic. :^(
The HW must be able to transmit digital data at, say, 1 to 10 MBit/s in a
range up to 5 to 10 km in urban areas (more in open terrain) using
omni-directional antennas.
I now thought, you tech-wizards would be able to tell me what the
transmitter/receiver schould look like, wich modulation I should
(theoretically ;^)) use and all such things wich must be considered.
Also I need pointers to widly available (scientific) litrature on these
questions, so I can give some references in my paper.

Please send answers as eMail or use the CC: field with follow-ups, 'cause
I'm on holiday for 3 weeks now, so I'll miss pure follow-ups.

Any help is really aprreciated!

Thanks, Kai

>73's

>Phil
>AD4WP

Phil check out the newest version of WinLink if your looking for a
windows program. My all time favorite is Lan-Link now in version 2.32
which is still a DOS program.

I found KAGOLD a totally frustrating program for use on
Pactor/Amtor/Gtor.....on Packet it was OK I guess. But I
like an all in one program.

Oh....the Aussie program Paket 6.1 is excellant once you
figure out how to run it. A lot of guys give up too quickly on
it. I am waiting for them to bring out a GTOR version and
then will re-evaluate.

>
>>in black and white. That program is Autofax. Is there some software out there
>that decode in grayscale with this TNC? If so send me the ftp or http to some

I don't think you can do grey scale with the on board modem in most
TNC's. They mostly use the Exar 2201? for demod. This PLL chip only
gives you a 0 or 1. Not much chance for grey scale. Why not go to the
ARRL ftp server and pull down JVFAX 7.0. It is a great fax program.
It also includes a diagram for a "simplest" converter, this converter
uses a uA741 opamp as a comparator(it gets its power from the asycn
port). The program "counts zereo crossings and computes the proper shade
of grey. 8080 sends both maps and photos. black and white is best
for the maps. True grey scale is best for the sat photos. With a strong
clean signal, the simple opamp gives good results upto 16 shades of grey.

As a bonus the program includes a simple vco to detect the NOAA wx sat
9137.5/137.620). You simply feed the VCO output into the opamp. It
does work. The only problem is some systems have trouble save images
in the NOAA mode. I have not had any problem saving the HF fax images.
(I said Exar 2201 I think the fsk demod is the 2211 and the 2201 is the
FSK mod.
Good luck

Jim, just curious, but why did they need to give you a new number?
Couldn't they just have changed your new serial number and
accomplished the same thing?

>Colin McGregor - VE3ZAA

I think you will find that what you propose is not so simple. Besides
the fact that you are dealing with miniature electronics which are not
easily (if at all) modified, you should also know that cellular
communications is designed to be controlled by cell sites. That means
channels are switched by the cell, calls are "handed off" to adjacent
cells, and a whole raft of problems. What you want to do would be
better handled by converting older SMR equipment. In fact, what you
want to do would be far easier by just simply adding an autopatch to
an existing repeater or adding full-duplex autopatch (with the
appropriate control functions). :)

3360. Where to obtain 56 kbps packet modems?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-07-27 00:00:00 UTC
From: Abe_Schachter_at_TELCOM1@tecnet.IS.irs.GOV
Message-ID: <9506278068.AA806883071@tecnet.is.irs.gov>
Source record: 42238

Hello all,

A couple of us here in the Washington DC area are interested in experimenting with 56 kbps modems on packet. I have heard and read a bit about the GRAPES and WA4DSY modems. Would appreciate any information on where to obtain these units and also what else is available. Also, what radios are people using which can handle the higher bandwidth?

Thanks, Abe N3BBF

As someone who has used both, the KAM has a better track
record, is of better quality and generally works better than
the MFJ produsts. The only factor that would make me go
with an MFJ over a Kantronics is if running a node. The Kantronics
node feature is not as functional as the TheNET software being
run in the MFJ TNC2 clone. This is only applicable to the packet-
only machines though. As for HF and multimode use, I prefer the
AEA machines :) I would be surprised if you get many responses
in favour of the MFJ over the KAM+.

> Netscape with Net/Mac or other stuff to conect the internet via radio.
> Any help will be appreciated.
>

Yes, it works amazingly well. Details of my arangement appeared in the
Packet column in July QST. Making a long story short, it involves using
Net/Mac as a router, attaching Appletalk, and using a second machine
running MacTCP over LocalTalk.

For Netscape or TurboGopher to work, you will need access to DNS over the
radio. NCSA Telnet and Eudora work fine with just IP addresses.

What would be REALLY nice would be an extension for MacTCP to directly
support KISS (like the existing extensions for PPP, SLIP etc).

73,

Dave

Abe... check out my web page for the latest info on 56kb and higher...

http://www.mindspring.com/~bobm/

The GRAPES/WA4DSY 56KB modem is a radio which outputs about
1 mw out on 29 Mhz and then you use transverter with it to put you on the
band of your choice....

>Hi Frank, what the heck is Winlink? Lan link for windows?

No. Winlink is Aplink for windows, and, while a very fine program, is probably NOT what you're looking for. Winlink implements an HF MBO - the HF equivalent of a packet BBS and much more - and requires a BIG commitment of equipment and energy.

If you're looking for a windows program for your Kam, download KaWin and give it a try. If you can sweat your way past the irritation of the nag meter, you'll find a fine host mode program that does about everything you'd want.

From: jrybak@mesa5.Mesa.Colorado.EDU
Message-ID: <3vauri$j4m@mesa5.mesa.colorado.edu>
Source record: 42110

I want to buy a low-end (price wise) new, bare-bones PC, likely a 486-66 to be used only for digital HF amateur modes. My concern is whether or not RFI from the PC could be a problem as far as my receiver is concerned. (I know that PC's are SUPPOSSED to meet FCC requirements concerning RFI but do they actually?)

Does anyone have any suggestions concerning 1) what brands of PC should be avoided because of RFI? and 2) how difficult is it to clean up RFI from a computer if you do have it? Conversely, what brands of PC's are especially QUIET as far as RFI is concerned?

Thanks for any suggestions you may have.

> available. Also, what radios are people using which can handle the
> higher bandwidth?

See the ARRL book _Packet: Speed, More Speed, and Applications_, for
a through treatment of the WA4DSY RF modem, and other higher speed
data systems. The WA4DSY modem is an *RF* modem and thus *is* the radio.
Voice grade radios don't hack it at higher data speeds, witness all
the troubles people have making even 9600 baud play through a voice
radio. A transverter is required to shift the 10 meter output of the
modem to the UHF band of your choice.

The WA4DSY, aka GRAPES, RF modem kit is available currently through GRAPES
for $250,

GRAPES
PO Box 636
Griffin, GA 30224

And will soon be available from PacComm, in a somewhat redesigned for
manufacturability form, as a wired tested unit. No price or availability
information at this time. (This could be a while before release, if you
want a modem now, order the kit direct from GRAPES. Assembly and tuneup
are not difficult for an RF project.) Remember, these aren't backward
compatible with 1200 baud or 9600 baud modems, so get a pair, or get some
buddies together for a group buy.

3376. Perseids Meteor Shower Test

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-07-28 00:00:00 UTC
From: horzepa@gdc.com
Message-ID: <3vb6a2$km8@gate2.gdc.com>
Source record: 42113

NATIONWIDE 2 METER METEOR SHOWER TEST 11-15 AUGUST

The August QST Packet Perspective column by Stan Horzepa pondered
a plan to test 2 meteor scatter. LETS DO IT! Amateurs Nationwide
are hereby encouraged to participate in the Persieds Meteor
Shower which will peak on 13 Aug. Although 6 meters is far better
than 2 meters for meteor scatter work, everyone has a 2 meter radio and
we can make up in numbers what is lacking in performance. All
you need is a TNC, and preferably high power and a beam. The objective is
to see how many grid square (DX) packets you receive over the 4 day event.

Here is the plan: Stations in the four quadrants of the country will
alternately transmit for 15 seconds. Stations will transmit the
shortest possible meaningful packet formed by placing their 6 digit
gridsquare in the UNPROTO TO callsign field. eg, W3ADO>FM18SX: The
suggested frequency is the ARRL experimental packet frequency of 145.79.
BE SURE THIS FREQUENCY IS NOT OTHERWISE ASSIGNED IN YOUR AREA. EVEN so,
you can still monitor!

STEP-BY-STEP SET UP PROCEDURES:

1) Point your beam towards a major population area about 500 to 1000 miles
away in one of the three other USA quadrants. If there is another 2m
local station, coordinate your beam headings so that you are not both
hitting the same azimuth and receiver target area.
2) Enter your grid square into your TNC using the following command:
cmd: UNPROTO FM18SX
(If you cannot estimate the last 2 digits, use AA)
Notice that there is NO VIA DIGIPEATER used!
3) ATTENDED OPERATION: Enter the converse mode (cmd: CONV) and
then each time you hit your carriage return key, you will send a packet.
Hit 20 CR's and you will send a bundle of 20 grid square packets.
Synchronize your clock with WWV and transmit as many CR's you can in
the following schedule:
North East stations transmit between 00 to 14 seconds
South East ... 15 to 29 seconds
South West ... 30 to 44 seconds
North West ... 45 to 59 seconds

4) UNATTENDED OPERATION: This will probably be the most successful:
a) Set your BEACON TEXT to ^HP where H and P are single characters:
H is beam heading divided by 10 and expressed by the digits 0 to 9
and then A through Z. 9=90, A=100, B=110, C=120... Z=350
P is the square root of your power %10. 1=10, 2=40, 3=90... 9=810
b) Set your BEACON to EVERY 1. This is not in accordance with the
scheduled 15 second cycle, but it is better than nothing if you are

operating un-attended.

5) Alternatively, run the APRS program version 71b or later, which has an automated mode for Meteor Scatter and will plot all received packets on the map. Also, in many areas, 145.79 is already being used for APRS. Read the APRS METEOR.txt file.

EXPECTATIONS: Meteor scatter paths are VERY specific between the transmitter and the receiver, typically any single event will only be heard by receivers within about a 20 mile footprint. This is why everyone can transmit at the same time in the same area, preferably pointing their beams in slightly different directions. As long as there is about 50 miles between identical TRANSMITTING stations, their signals will NOT probably hit the same receivers at the same times.

W0RPK and K1HTV did make a successful 2 meter packet contact in 1984 over about a 1000 mile path, but it took 2.5 hours of constant packets. Hopefully by having hundreds of transmitters, and hundreds of receivers, we can improve the statistics. The best time for meteors is in the early mornings from 0400 to 0800 LOCAL time. But it is not much worse the rest of the day...

REPORTS: Since you will possibly see packets that no one else will see, send all gridsquare reports (Only those known to be greater than 250 miles distant) to me and I will compile the data. Be SURE to include your gridsquare!

Bob Bruninga, WB4APR @ KA3RFE.MD or
bruninga@greatlakes.nadn.navy.mil (preferred)

P.S. The Naval Academy 40 foot dish (Annapolis MD) will beam towards Florida on the 11th, Atlanta on the 12th, the midwest on the 13th. Donno about the final 2 days yet. Expected ranges are only about 550 miles, though, because the elevation cannot get down below 10 degrees. The range to Atlanta and Indianapolis are about perfect for that...

Source record: 42115

Hi, I am would like to try hf packet and I have got a Kenwood ts-120s hf rig. I don't know if it will work because it doesn't have a rtty, packet or any type of switch for digital modes. It has USB, LSB, and CW mode switch on it. It has a 160watt output on 10 mtrs and 200 on 15-80mtrs. My TNC is an older kantronics 300,1200 baud tnc. I use it all the time for 2mtr packet and it works great. I don't know what model it is because it doesn't have any model on it. When I turn it on it says on the screen: Kantronics Packet controller Version 1.5 . I guess it is a KPC-1. Anyhelp would be greatly appreciated. 73's de Nels KE6IZC

3379. KPC-3 Real Time Clock Add-on

>As someone who has actually used the product for quite a while, I must

you assume too much. home is os/2 and the heavy work is unix, but the computer on the desk is currently windows by edict from above. and the company i work for has had people looking into windows /95 almost from before they could have a copy. in the past PC Week has been a very good parrot of the MS party line -- and here on the eve of this great boon to mankind the lab guys come out and say "Wait a minute!".

look around - there's stuff that's not going to be "fixed" until a dot-2 release that's been bandied about as a given in the trades...

My analysis will be that this is going to be the big help OS/2 has been waiting for. V3 OS/2 was copied for a lot of win/95 appearences.

please note the heavy work is done on Unix. it's not the big impossible to learn operating system just because the M'softies couldn't get Xenix to sell. DOS/windows has proven to be too unstable to be used for electronic design in our shop -- those folks that don't run a microsoft operating system have a tough time understanding that reboots are a way of life for someone using microsoft software.

>disagree with the assessmewnt above. THere is a great advantage in
>speed for multiple apps. The usability is DRAMATICALLY improved.
>150 MB?

it's at least 40 Mb. the test automation folks at work are reporting that it's more like 60-80 Mb for a practical system minus trimmings. 150 Mb isn't far from the mark if you just install "everything".

>Well, if you include MS Office 95 (Word, Excel PowerpPoint,
>and Access)--maybe. Does OS/2 include such a suite?

well, yes, they do...and it's not too bad.

>PC Week is NOT one of my favorite sources of information--they are
>often wrong.

so go look up the test details -- it sounds like anyone who just buys the windows/95 package is going to be sorely disappointed.

>Interesting that you would judge a several year long development
>project by a single article in a magazine that you seem to have little
>respect for.

except i had help from our internal folks (heard in a meeting -- "all those licenses are going to cost a fortune!" " no problem -- people just have to

'iconize' the apps when they are not using them and then they won't count
against the license server totals..." oh yeah?)

they (PC week) didn't like os/2 either...but it just runs and runs and runs...
we kill the unix servers only because we have to get in the closet.
and the windows users count on a crash a day....
i'm virtually microsoft free at home -- got one of their mice here.

>lambreyb@lhs.be
>Ben.

To tell you the truth, I've always used paKet with OS/2. It doesn't really need the multithreading capabilities of OS/2, expecially at 1200 baud. Besides, it will run quietly and peacefully in the background without slowing down the system, unlike under some other operating systems I know. You pay a wee price in memory overhead because you have to load an entire DOS session, but if you set your settings right, like for minimal memory requirements, the penalty is miniscule. I have also run JNOS with equally splendid results.

>>to that packet operator, you are guilty of intentional interference.

If performance-minded digital operators are using 500 Hz IF filters,
they don't HEAR the adjacent signals. The interferance isn't intentional!
This is happening all the time today, when newer hams are trying to get
their feet-wet on digital modes with 2.4kHz SSB filters. Folks are
complaining of busted links, when nearby QSO's have solid links..
The radios have to be compatible with the expected operating bandwidth!
And operators should try to be aware of what mode nearby stations are
using. Plopping down in the middle of the RTTY DX area on 20m with a
PacTOR mailbox is pretty tacky. And probably WILL lead to intentional
interferance!

Newsgroups: rec.radio.amateur.digital.misc

In article <3vde3p$fb9@krel.iea.com> you wrote:
: I recently through a trade obtained a (mostly) working Compaq Portable
: II, which I intended to use as a "smart" terminal on RTTY.
: This is a circa 1989 8MHz AT Clone.

: I need a manual. or in particular info on the jumper and switch settings.
: Also how do you invoke the CMOS setup on the beast? the old standby
: CTRL/ALT/ESC is not the key (pardon the pun).

A trick to CMOS that usually works (Compaqs are funny creatures, so no
promises) - Power off then power on. Hold any key down during the
entire POST. You will generate a keyboard "ERROR" and directed to CMOS
to "Fix" it.

Alas, Many compaqs had a disk to run the CMOS change programs- No way to
get at it without it. If the above trick doesn't work, start looking for
that disk (call compaq, etc)

Best of luck,

Source record: 42128

Jeff,

Off the subject, I just wanted to say that I have been following your articles as much as time permits! Good job well done. Long time no hear! Last time we talked was salt lake city gateway! With AA5DF. Remember?

To everyone:

ON the subject of windows 95, I run a 486 slc 66 (sx with a 16 bit bus) cd-rom, Colorado tape backup and 5.25 and 3.5 floppy drive. Vesa Local bus. 8 Megs of memory

I have run both Os/2 - warp and Windows 95, played with unix, and will (near future) run Open VMS on a DEC Alpha 4/266 MHz machine.

Education: MSEE

For all you Os/2 - Warp fans out there: Why are you so threatened? Why?

It bogs down my machine, more, crashes more on my machine, Runs Slower because it has more overhead and has to load a DOS session so it can run windows! Talk about putting something unstable on top of something stable and then think that you are safe. Run the program and pound on it, sure it might save you from GPF's and might keep you going at a SNAIL's pace but you will keep on going like the energizer bunny!!

Total crashes 3 total time of use on my computer 3 months

Windows 95 - ahhhhhhh - says it all!!!! Only crashed once one first build (preview addition 1) and once on the second build (June test release)

Total crashes 2 approximate time used 3 months.

Draw your own conclusions: But I know I am not a brain dead! And I have made the choice for me! From my conclusions, if you have the horse power and don't mind the over head then it would be a race between NT and Os/2 but when you are talking ease of use and quick easy installation, I know windows 95 wins there!

Please keep in mind three things before flaming me with hate mail.
1. My best friend who is a Os/2 computing ZAR loves Os/2 and has great reasons (none for me but good reasons)
2. I have tried both and both, BOTH, HAVE there own good points!
3. I like people not hate them!

Thank you for my soap box

3392. Packet Data Amplitude for 9612/733?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-07-29 00:00:00 UTC
From: dhinch@cello.gina.calstate.edu
Message-ID: <3vef9d$jkm@cello.gina.calstate.edu>
Source record: 42129

I am trying to get the TM-733/KPC-9612 combination working on 9600 baud. I can receive fine but am having trouble connecting. I found that if I changed the J6 jumper in the 9612 to DC coupling and increased the amplitude of the data to the radio by adjusting R32 I could connect although I still have quite a few retries. I am continuing to experiment with this adjustment. Does anyone know what the amplitude for the data to the 733 is supposed to be as monitored with a scope? Any other suggestions on how to set this up?

Thanks in advance.

I have access to a KAM ver 5.02 and the ALT 192, ALT 255, ALT 192 doesn't work with it
but does work on my KPC-9612 and my KPC-3. Has anybody else had this problem??

3394. COMPAQ PORTABLE II HELP

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-07-29 00:00:00 UTC
From: n0dh@comtch.iea.com
Message-ID: <3vde3p$fb9@krel.iea.com>
Source record: 42131

I recently through a trade obtained a (mostly) working Compaq Portable
II, which I intended to use as a "smart" terminal on RTTY.
This is a circa 1989 8MHz AT Clone.

I need a manual. or in particular info on the jumper and switch settings.
Also how do you invoke the CMOS setup on the beast? the old standby
CTRL/ALT/ESC is not the key (pardon the pun).

Dave
n0dh@comtch.iea.com

If the opposite of "pro" is "con"
then doesn't it seem logical that....
the opposite of "progress" is "congress"??

3395. Running Baycom software with 'normal' TNC?

Newsgroup: rec.radio.amateur.digital.misc

From: jdc3538@osfmail.isc.rit.edu
Message-ID: <3vdlgq$jv0@news.isc.rit.edu>
Source record: 42132

I have heard that Baycom software can be used with a regular TNC. Any ideas? There is no mention of other hardware in the Baycom documentation that I have.

Also, is there any other public domain terminal sofware that even comes close to Baycom?

73...Jim N2VNO

-> Does anyone have any suggestions concerning 1) what brands of PC
-> should be avoided because of RFI? and 2) how difficult is it to clean
-> up RFI from a computer if you do have it? Conversely, what brands of
-> PC's are especially QUIET as far as RFI is concerned?
Hi Jim.
I am a digital modes user for the last few years.
I was using a NorthGate computer 486 DX its an American company but
manfuctured in Taiwan.
i used that for packet and Amtor i was having lot of RFI from the radio
to the computer some time it stopped the computer i start grounding all
every thing in the shack witth good grounding also i added a ferrit ring
to the computer cables.
after that i noticed RFI from the computer to the Radio as:
when there is a good propagation i dont have any problem from 14MHz and
above but for 30 40 18 meters still i have RFI and if the propagation is
bad i have RFI on 20 also..
I re locate the Antinna [Rotary dipol] it help a lettle.
i was accepting that situation.
befor 8 monthes i got a new computer Pentium frrom Gatway 2000 with Sony
monitor and i tell u i never have any problem from my PC at all
but still every thing still grounded but not the PC i can work even 80
meters without any complain..
hope this simple experince w,ll help.
best 73,s and good luck.
de Ibrahim.

3399. KAGOLD (AND PKGOLD)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-07-30 00:00:00 UTC
From: wa4egt@interflex.COM
Message-ID: <9507291605.0MM0M00@interflex.com>
Source record: 42136

We often get requests for information, as we did from AD4WP, send them a newsletter and brief outline of the features of our software, and hear nothing back. K0JPJ (ex W5PVX) who concurred with AD4WP's opinion of KaGOLD was interesting as well, as neither of these people are registered users of KaGOLD.

This is not to say they might not have tried the very limited testdrive program (which does not support Pactor or Gtor by the way). We freely admit that the testdrive is not full-featured, and runs for a limited time, but it does give prospective users a general idea of the program, but is (we admit) not a complete program.

Many users who buy KaGOLD write to us and we have hundreds of comments, and letters to the effect that they have run XPKAM, paKet, Host Master, and other programs, and that KaGOLD is easier to run, more stable, and has far more user friendly features than any of the other programs.

We sell to military, government agencies, public safety groups, and hams worldwide. The conference feature has been used during many emergency situations, and the remote command system, huge scrollback buffers, dual port operation, and very complete on-line help system have been praised by many users.

It is unfortunate that non-users post information based on at best a cursory look at the program. Perhaps a user who is running a current version of KaGOLD, and has run other programs, can provide some in-depth comparisons that are more complete, and would be helpful to users looking for a quality program, with lots of features that is easy to use in all modes.

We have put many features in the program at user request, and there are many advanced capabilities that most users may never use, but we keep the screen uncluttered to avoid the imposing look that some complex software screens present to users.

Hopefully, users will ask other registered KaGOLD and PkGOLD users to make comparisons, and rely less on the opinions of those who at most have read the a newsletter, or run the (admittedly limited) test drive of our previous version 8 program, which is indeed frustrating in Pactor and Gtor mode (the testdrive doesn't support these modes).

Our latest KaGOLD, as of July, 1995, now supports GMON, which allows simultaneous G-TOR monitoring and packet operation. We have implemented G-TOR monitoring in a way that makes it far easier to operate from that mode, and does not require the user to switch modes to make GTOR contacts, or to switch back to GMON, it is all automatic in KaGOLD, but can be done manually as well if desired.

Source record: 42138

Doug:

Installed 8.0 last night (after the bands were dead) and today found several stations on gtor (14080.1 and 14106.3). Gmon worked fair/good on the first station and poor/nil on the second. But, QRN level was very high today.

Seems that because of the complexity of the gtor frames it takes strong signals with minimal noise/phase distortion to get any copy at all. Will say this, compared to software GMON version, it is immediately apparent that the firmware version is not only easier to use but performs better.

Frank:

Interesting your perception of KaGold. Have been using it for several years while also trying most of the others. Always come back to Gold. I find it clean, straight forward, especially easy to grasp and use: it's intuitive - except for some of the more obscure commands, you don't even need to read the users manual.

On the other hand !!! Just received KAM firmware 8.0 (which work fine) and also ordered Hostmaster II+. What a poor program - kantronics should be giving that away for free just as they were (are) pacterm. Johnson's xpkam is far superior to Hostmaster and both are a very distant 2nd/3rd to KaGold.

Gonna be on 6-m for meteor show ?? How about 1200 baud fm packet on 50.62 ?

From: frankg@panix.com
Message-ID: <3vf601$bdo@panix.com>
Source record: 42145

I have noticed now that I have x1j rev 4 running that when I upload
a new IPROUTE the node will spit back ALL the iproutes. The older
versions did not do that. When I upload a new ARP it does NOT spit back
the entire ARP table.

The problem is that I have 40 + iproutes now and when it returns the
entire iproute table the node runs out of buffers and crashes! Its taking
forever to get these routes in there!

ANyone else having this problem?

e-mail is prefered as I dont always wade thru this newsgroup.
Thanks.

Jeff:

On another thread in this group I posted my opinion of KaGold. It is in sharp contrast to the contrary remarks of one other person.

New Subj: Installed V8.0P KAM firmware. GMON worked reasonably well when monitoring just a couple of stations. With V9.01 (1994) used alt-F3 to get into terminal mode and did GMON that way. Which version of KaGold do I order now to accommodate the 8.0 firmware ?

As an aside, when I ordered the firmware decided to try Hostmaster II+. What a bad decision on my part to spend $65 for a program that doesn't even perform as well as Gary's xpkam. Kantronics should be giving that program away for free (or at a very minimal cost) just as they do with pacterm. Selling that for $65 is certainly NOT a good way to keep customers happy !

>KPC-3? I'm at a loss where to look for these parts.

No kidding. I went to all the chip dealers I knew and came up empty:
Fry's, ACP, and Marvac (So. Orange County, CA).

Apparently, only Dallas Semiconductor makes it, and there are no clones
out there. I figure the only way we'd ever get one was to try and call
DS directly or get it from Kantronics. I never got around to calling
either since I can't seem to hit any digipeaters from home, so it's
not really a priority.

I happen to have a 1990-91 data book with the part in it. It is called
the "Phantom Time Chip." It comes in two packages: 16-pin DIP and 16-pin
SOIC (which looks like a surface mount package). We'd need the DIP of
course.

I hope this is current:

Dallas Semiconductor
4401 South Beltwood Pkwy.
Dallas, TX 75244-3292
214-450-0448
FAX: 214-450-0470

I found a letter in the back of my data book. Here's an excerpt:

You can also order any Dallas Semiconductor product for quick shipment
with a Visa, MasterCard, or American Express. Just call and ask for
our dedicated Overnight Delivery Service at 800-336-6933. If calling
from overseas, dial 214-450-5351. Or, FAX your order to us at
214-450-0470.

This letter was not dated nor signed with a real pen it wasn't too far
from 1990-91 though.

If you do happen to get the chip, please let us know.

3412. Free - New Mac Ham Tests +

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-07-30 00:00:00 UTC
From: john@wd1v.mv.com
Message-ID: <john-3007950600450001@wd1v.mv.com>
Source record: 42149

The new Macintosh Ham Test Simulators are HERE!

Novice Ham Test 5.0 SA.sea
Technician Ham Test 5.0 SA.sea
General Ham Test 5.0 SA.sea
Advanced Ham Test 5.0 SA.sea
Extra Ham Test 5.0 SA.sea

The latest versions feature:

HyperCard 2.3 as a stand-alone application (SA) eliminating
the need to have HyperCard. All you need is a Mac with 4
Meg of memory and version System 7 or greater.

Each version 5 Ham Test Simulator has the latest questions
as prepared by the Question Pool Committee.

Each Ham Test Simulator is FREE OF CHARGE and work the
same way as the originals written by Diana, KC1SP.

You may obtain a Ham Test Simulator by mailing me a *FORMATTED
disk (1 per test) and include a Self Addressed and Stamped disk
mailer for the return.

Each Ham Test Simulator is also bundled with a shareware CW
program called MacMorse 1.4 written by Doug, WB0EON.

Also included are a collection of text files that relate an
interesting variety of ideas about the best way to study CW and
prepare for tests.

If you load these onto file servers where others can gain access
via Internet, please let me know so we can point others in that
direction.

Your comments and suggestions for future versions are always
welcome. Stay in touch and good luck with your next test!

3418. 50 MHz wireless data systems

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-07-30 00:00:00 UTC
From: 74721, 341/GO: PPPCONNECT@compuserve.com;
Message-ID: <3vgh60$6lg@dub-news-svc-1.compuserve.com>
Source record: 42155

Is anyone familiar with any wireless data systems operating around 50 Mhz?
If so what data rates are normally used in this band?
Thanks, Steve

3419. Packet on a Mac???

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-07-30 00:00:00 UTC
From: dd650@cleveland.Freenet.Edu
Message-ID: <3vgm5g$k7p@usenet.INS.CWRU.Edu>
Source record: 42156

I am wanting to get involved with packet, but I have a few questions about it's capabilities. THe biggest on is, are there any TNCs for a Mac or rather, is there a way to make a cable for a Mac to a TNC?
The other big questions are if you can you mail to and from anyone on the Internet including AOL like you can with tenet or any other service? When you are on the packet network, can you get to the Unsenet groups or subscribe to internet listserves? Can you use such commands like FTP, Telnet, gopher, etc.? I looked in a magazine and saw a an ad for a TNC and it was very reasonable. It was only like $129, but it was relatively slow one that had a maximum rate of 9600 transfer with the computer port. What are some good models to consider? Also, what are the possibilities for a slip connection wiht packet for the use of Netscape to navigate the WWW?

Thanks for any info!!

Drew Loker, loker@tenet.edu

3420. Re: Where to obtain 56 kbps packet modems?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-07-30 00:00:00 UTC
From: Bill Schaff <schaff@iiiv.tn.cornell.edu>
Message-ID: <3vgoi4$473@newsstand.cit.cornell.edu>
Source record: 42157

> A couple of us here in the Washington DC area are interested in

> bit about the GRAPES and WA4DSY modems. Would appreciate any
> information on where to obtain these units and also what else is
> available. Also, what radios are people using which can handle the
> higher bandwidth?
>
> Thanks, Abe N3BBF

Consider the "Wireless Communications Modules" from Micrilor 617-246-0130 (possibly 617-246-0103 -their literature has both numbers listed). These are 902-928MHz transceivers/modems with RS232 data rates to 115KB. Simply plug in a cable with RS232 and 3V DC - a pigtail of coax is provided for coaxial connection.

Again their literature is confusing - they quote a price of $275 in quantities of 100, but it is not clear if that is the price of a single unit, or a pair.

: This is wonderful, for those who desire to learn UNIX

Fine, you don't have to learn it. But you'll be missing out
on additional power that the system can provide, when compared to
the barely-stable functionality of the various incarnations of
MS-DOS/Windows. I'm currently running a fully-connected internet
node, AMPR tcp/ip gateway, HTTP server, and acting as a firewall
for my wife's OS/2 machine on a cheap 386/33 with 8MB. And my system uptime
is 129 days, without a crash. Windows wouldn't stay up for a *day*
under those conditions. I know, because I've tried.

: >It's not intended for dim bulbs who can only point and click,

: Dim bulbs? You mean like all those research scientists that use X
: Window?

I believe Gary was refering to those people who refuse to put out the
effort to use the most appropriate tool for the stated purpose.
Regardless, XWindows is NOT the OS - it's merely a presentation layer for
applications. WinX, on the other hand, proclaims itself as an OS with
a standard presentation layer. A subtle, but crucial difference. You
can replace X with MGR, et al. if you don't happen to like it. With
WindowsX, the most you can do is replace the Program Manager, which
is not at all the same thing.

: >though you can make it emulate an Etch-A-Sketch too if you start up X. Unlike Windoze,
Linux
: >won't crash because an application went nuts,

: Never heard of a kernel panic, eh?

No, I've never encountered one with the 1.2.x kernels. I do,
however, GPF my Windows machine at work an average of 5-6 times

per day, with the help of your much-vaunted commercial software.
Word 6.0, typically, is the immediate cause, as it merrily stomps
through other applications descriptor arenas.

: >and unlike
: >Windoze 95.8, you can actually have more than 4 or 5 tasks
: >running at the same time, and they'll actually have some decent

: Hmmm... last time I checked, my desktop machine running Win95 was
: doing everything I needed. My Linux machine, on the other hand, was
: sitting idle with a blown-up file system, waiting for me to fix it.

I hope you have a good backup, considering that our machines with
the Win95 "Golden" beta blew away several filesystems in quick
succession. When they managed to stay up, of course. Pretty sad
when you consider that it was running on Compaq machines, which are
as standard in the business world as you could ask for, whereas
my home Linux node is performing an order of magnitude more work
on a $50.00 Pacific-rim clone motherboard.

: My SPARCStation was humming right along, though it had suffred from
: the same power failure and was--unlike the Linux box--actually doing
: things to the file system at the time.

: >available for Unix will compile and run fine, and then there are
: >the hundreds of tools that come with the package, including industry
: >standard text processing and the industry standard C complier, no
: >I *don't* mean Microshlock C. There's little need for outside commercial
: >apps when the OS itself isn't a pitiful crippled thing.

: Can I get WinWord 6.0 for Linux (and please no discussions of Tex or
: Emacs, there is NO comparison. WinWord is a spectacular tool that
: doesn't require a lifetime dedication to learning.) How about Excel?
: How about the hundreds of other slick, easy to use products that are
: designed to run under Windows? Face reality--eunning applications may
: be your hobby, I like to get work done.

If you like to get work done, why in the world are you using an OS
that crashes every hour, claims to be "32-bit" when it is, in fact,
no such beast? As for your beloved commercial applications, try
looking in any magazine devoted to Unix, and you'll find that a large
number of commercial vendors who sell Windows apps have versions for
Unix, as well. You may have heard of niche product called "Wordperfect",
for example. As for Word 6.0 being a "spectacular" tool, well, I suppose
if you want to call an application that regularly trashes its files,
whose filters can often translate less than 50% of a converted file
correctly, and that crashes more often than not, you're entitled to it.
Just because you don't see the commercial Unix apps advertised in the

Sunday paper doesn't mean that they don't exist.

: >And speaking of ease of configuration, ever try to back some commercial
: >apps *out* of Windoze? That's enough to make most users just want to
: >type "FORMAT C:". In fact, anybody doing development on a Windoze system
: >has probably typed that more than once as the brittle system screwed itself
: >royally when it crashed, and your only hope is to reach for the install
: >disks and start over. I won't even start on load order in config.sys and
: >autoexec.bat for all the conflicting and incompatible drivers.

: Even accepting the above--arguendo--so what? Linux is an order of
: magnitude more difficult to configure!

Check out the CD-ROM distributions. Pop in a boot disk, follow some
simple prompts, and you're done. Just like DOS. If you want to
act as a mail or TCP router, you are going to have FAR more difficulty
getting it to work correctly under DOS/Win that you are under
Linux/Unix, simply becuase there is no standardization. On the
Unix box, all you have to do is check out one of the innumerable
O'Reilly books, which can be understood by anyone who has enough
knowledge to press the "on" switch.

: It is UNIX, silly person. It
: requires an ENORMOUS amount of esoteric knowledge to use. It is fine
: if you want ot use it as a hobby or maybe even as a server (get
: Solaris!) but it is NOT competitive with Windows 95 on the desktop.

As Gary noted, Winx is fine for the person who wants to spend their
time kerning letters until it looks *just* right, but if you have
needs that require stability, predictability, performance, and
repeatability, you're going to have to look elsewhere than DOS/Windows.

I am using packet on 2-m with a KPC-3 TNC and a Mac Powerbook (145). The
TNC manual has diagrams for making the TNC-radio cable, for several
types of radios (I am using an ICOM 2GAT). I would expect that most
TNC vendors would provide equivalent information for their units.

Yes, you can send (and receive) e-mail via packet hamgates (if there
is one near you). I have also made a telnet connection to a host, but
a) it is *very* slow at 1200 baud, and b) you compromise your password
as anyone can read it from your transmitted packets (I changed my
password immediately upon logging in). I've quit trying telnet via
packet because of these limitations (and because I have better hard line
connections).

Others will have to tell you about IP/TCP (KISS mode) on packet, and
higher speed TNCs.

I am pleased to announce a new product offered by Positive Time Systems
called the RCS-I. This is a radio controller that connects to any VHF/UHF
transceiver and can issue x-10 commands. The unit also has an alarm
input, a listen feature, a short voicmail box, and responds to all
commands in a pleasant female voice. The system IDs with your recorded
voice and call sign.

This description doesn't do the product justice, so
please check out the new homepage at :

http://www.halcyon.com/pos.time.sys/top

Or, email your mailling address so we may send you a brochoure and
newsletter.

Thank You,
Marshall Craw <mcraw@halcyon.com>

I already know it--I was referring to those that have no need to know
UNIX.

>But you'll be missing out
>on additional power that the system can provide, when compared to
>the barely-stable functionality of the various incarnations of
>MS-DOS/Windows.

This is a gratuitous assertion. It is not borne out by my experience,
and it is clearly not possible since the OVERWHELMING MAJORITY of
desktop computers used in business run this software.

>I'm currently running a fully-connected internet
>node, AMPR tcp/ip gateway, HTTP server, and acting as a firewall

I am currently running a fully connected Internet node, and
router/firewall under DOS! So what? Did I suggest that Windows was
the correct choice for all purposes? I use what makes sense for the
job.

>: >It's not intended for dim bulbs who can only point and click,

>per day,

Sounds like you need some help configuring your Windows machine, or
you need some realistic expectations about what your machine is
capable of. I use Windows ALL DAY and rarely require rebooting the
machine, though I am using many large applications. Usually a reboot
is required because I have installed an ill behaved application to
test it.

>with the help of your much-vaunted commercial software.

Sorry, that is just installation--I said CONFIGURATION. I suppose the
CD-ROM somehow knows what you want the system to do, knows the names
of your users, your new network addresses, etc.

>Just like DOS. If you want to
>act as a mail or TCP router, you are going to have FAR more difficulty
>getting it to work correctly under DOS/Win

Now why would I go and do a silly thing like that with a Windows
WORKSTATION.

Now wait a minute, you just wrote a couple of hundred words on how awful, unstable, poor performing, etc Windows is--and now you say it's "fine"? Which is it? Is it the horrible crime against computing you've made it out to be previously, or is it "just fine" for people who want good looking documents using WYSIWYG applications?

>but if you have
>needs that require stability, predictability, performance, and
>repeatability, you're going to have to look elsewhere than DOS/Windows.

My Windows NT machine has been running as a file/FTP server for MONTHS, without a minute of downtime. My Windows 95 workstation has turned out all the materials I need to make my living without any catastrophic failures or lost data. Word, Excel, Photoshop, Fractal Design Painter, Agent, Eudora, Netscape, Corel Draw!, HP DeskScan, Reflection X, Reflection2, and a variety of other apps all run quickly, stably, predictably, and SIMULTANEOUSLY on my Windows 95 machine (486DX/2 80, 16 MB) and have been doing so for months.

There I said the opposite of what you said, and I am DOING it. Who should readers believe?

Hi folks, KC4UEB, Rich, here. I have a friend using a Baycom modem, with Version 1.4 software. I know the newest version is 1.6, but I can't find it anywhere to save my life. Even Baycom's own homepage is no help, mostly because it's not done yet. I can't even tell if they're trying to say it's public domain or not. Anyone know the story, and/or where to ftp/buy the latest software?

Also, if anyone knows, is there a way to convert the Commodore version of the Digicom modem for PC use? Thanks.

Use the same cable for a TNC as you would for a telephone line modem. I even like to use the same software, VersaTerm Pro.

> The other big questions are if you can you mail to and from anyone on

Depends on what kind of connection somebody has established in your area between the tradional wired internet and the packet radio network. Basically traffic from the wired internet is not freely allowed on amateur radio networks unless it is known to have originated from an amateur radio station.

To run an amateur radio TCP/IP stack on a Mac you need NET_Mac*.hqx, IM_Mac*hqx, and Net_Mac_Environment*hqx (don't cut & paste those filenames for download, I'm typing from memory) available at any good Mac ftp site including ftp.ucsd.edu/hamradio/packet/tcpip/mac. See also /hamradio/packet/tcpip/incoming for latest versions.

Yeah, but 9600 isn't the part that should concern you, its the 1200 baud stuff at the radio, and with radio protocols too you'll see thruput akin to a 300 baud telephone modem. In all honesty it sounds like you are looking for a cheap way onto the internet. You won't find it in amateur radio.

> What are some good models to consider? Also, what are the possibilities
> for a slip connection wiht packet for the use of Netscape to navigate the
> WWW?

I understand it has been done with various hardware including Macintosh. But then again there are those out there that will climb any mountain just because its there. BTDT.

: --
: Rich@gate.net

Hi Rich - The reason you can't find v1.6 is that it is a commercial
product (no shareware after v1.40). You can get it from Tigertronics
(503-474-6700) for $20. Actually, they are just collecting the same old
shareware fee "up front" now. They have setup distributors who solve the
currency exchange problem for all concerned. Actually, I think it works
better for everyone and they are assured on getting modest funding to
continue the great work they are doing.

My religion is Judaism, Dirk. I have no axe to grind for Microsoft.
Remember how this thread started. The title is, "How will Windows 95
help us?" The response--somehow--magically transmuted into an
advertisement for public domain UNIX. I simply want those who might
be confused to know that Linux is NOT the universal solvent of Intel
platform operating systems. There is plenty good about it, there are
many good applications to which to put it, but IT IS NOT AS
REPLACEMENT FOR WINDOES 95.

>Now I don't mind how you dress up in private, but please (children)

>or rather, is there a way to make a cable for a Mac to a TNC?

Sure, the same cable that works with a telephone modem will work with a TNC.

>The other big questions are if you can you mail to and from anyone on
>the Internet including AOL like you can with tenet or any other service?

Sometimes, if there's a gateway station you can reach. Packet and the internet share tenuous connectivity at best. And gateway stations have to make sure any traffic is legal for amateur radio transmission.

>When you are on the packet network, can you get to the Unsenet groups or
>subscribe to internet listserves?

In general, no, though it depends on how liberal your gateway operator is.

>Can you use such commands like FTP,
>Telnet, gopher, etc.?

Absolutely. The full functionality of TCP/IP is available to amateurs, for use *between* amateurs. Dragging files down from the internet is another matter, again one you'd have to take up with whatever gateway station you can find. I don't know of many who would allow that.

>I looked in a magazine and saw a an ad for a TNC
>and it was very reasonable. It was only like $129, but it was relatively
>slow one that had a maximum rate of 9600 transfer with the computer port.

<snicker> 9600 baud is considered *fast* in amateur radio. The speed you will normally find being used is half duplex 1200 baud (Bell 202) which subjectively feels slower than 300 baud telco connections thanks to the various delays in the radio systems and the contending nature of the radio channels. There are *fast* packet radios available, with the WA4DSY (aka GRAPES) 56 kb RF modem being the leading example. But they aren't yet in widespread amateur use.

>What are some good models to consider? Also, what are the possibilities
>for a slip connection wiht packet for the use of Netscape to navigate the
>WWW?

It can be done, but you need a fast system, and someone else with a fast system, like the 56 kb RF modem mentioned above, in order to do it with any reasonable functionality.

The problem with packet is that most of the users are stuck in 1977 as far as techniques and equipment are concerned. You can do a lot of non-realtime stuff at that level, but you need to move to the higher speed systems to approach the current wireline SOTA.

You can't do packet with that setup. Packet uses either Bell 103
300 baud half duplex on HF or Bell 202 half duplex on VHF for
the most part (there's faster stuff, but it's totally incompatible
with telco modems). Your modem doesn't support either of those
standards, or half duplex operation.

What you *can* do is setup a full duplex link with another amateur
and use your modem as if it were on a dedicated 4-wire network.
(Use a 4-wire to 2-wire hybrid on each end.) That way the modems
can train with each other and operate just like you'd dialed up a
phone line. That's not packet, but it is digital over radio.

Gary, do you know anyone who is doing that? That would seem to make a good point-to-point link, and allow relatively unmodified radios (well, unmodified except for full-duplexing) to have a decent throughput (at least at 28.8.) I am trying to figure out what actual PACKET high speed stuff is going on in our area, but so far, I have not really found any.

What do you think about 10 mbps point-to-point microwave links? It would be interesting to run ethernet over radio, if you programmed an appropriate ID setup...

I thought others suffering from the woes of intermod might be interested in this item. The use of a bandpass filter has improved our repeater beyond our expectations.

A new filter is now available to help suppress intermod at repeater sites, mobiles, and home stations. Digital Communications Inc., of White City Sask. Canada is manufacturing a Two Meter filter that meets or exceeds the characteristics of another well known supplier who markets a four cavity filter. The filter has a bandpass of 4Mhz. Price int the US is less then $100.00 and in Canada is around $125.00. Amateur suppliers in both Canada and the US are selling the unit. For further information, contact:

Digital Communications Inc.
Box 293, White City
Sask., Canada, S0G 5B0.

Fax 306+781-2008
Direct telco 306+781-4451
From the USA, call 1-800-563-5351

Well worth while to look into.

Maybe they left the "borrowed" account in place to make it easier
to catch the guy using the cloned phone. Cel companies are
getting very aggressive in responding to this kind of abuse.
It was cel phone locator technology that nailed Mitnick the
last time. BTW, folks thinking about this kind of mischief
should read _Cyberpunk_ by Hafner and Markoff or _The Hacker
Crackdown_ by Bruce Sterling (there's electronic versions of
this one floating around the Well). The stories are interesting,
but the result always seems to be the same: brilliant folks,
who could have been giants in the industry really messed up
their opportunities by misdirecting their talents. A great
programmer can earn a lot more than he can steal. JMO

Source record: 42049

Hi all,
In response to many queries, I can confirm that version 3.0 of UltraPak,
the Windows packet terminal program is about to go out to beta test.

Version 3.0 contains many new features added since version 2.1
including:

* Personal BBS (PBBS) with auto forwarding
* New connect list interface
* "Point and click" reading from BBS listings
* User definable CONNECT log
* Script files in the connect list

and more!

There is no extra cost to registered users. Expected release date is around
the end of September. Watch this space!

Well, mine exits gracefully, but the reason I'm not test driving it is
that I don't want to be in the middle of a QSO and have the program
exit! Operating in a digital mode, you can't simple key out your call,
or pick up a mic to wrap up the QSO. Doc says that you should be able
to re-run the program and pick up where you left off, but I don't want
to risk it.

The program could simply not run again if it was being used too much, or
simply not allow a 'transmit' condition. No one leaves their computers
on *forever* running just one program (after all, this *is* Windows &
therefor needs to be rebooted every few hours ;-)) so testing at
startup should be fine.

You betcha! You can go directly to

http://www.com-west.com/com-west/b-dx.htm

or a better place to start browsing for ham radio stuff with a Canadian
flavour is:

http://ve7tcp.ampr.org/

which will get you to Com-West services also. (Com-West being a commercial
outfit with links to other web services)

I don't know of any amateurs doing it *now*. Many years ago, WA4DSY and KD4NC were using original Hayes modems that way, of course that was when 300 baud was hot stuff. :-) And I have some 900 MHz duplex radios by Grainger that are setup to duplicate a wireline connection. They were being used with ordinary telco modems by the previous owner, Georgia Power Company, to control their switchyards before they switched to optical fiber links and surplused them off. Some of the new dualband radios available to amateurs could be adapted to the purpose rather easily.

>What do you think about 10 mbps point-to-point microwave links? It would
>be interesting to run ethernet over radio, if you programmed an
>appropriate ID setup...

The only flaw with ethernet over radio is that the CD mechanism of ethernet won't work. On a point to point link, that only costs a few retries, so it should be OK. Any old TV STL microwave should work. I've got my eye on a pair of transmitters and receivers that are going out of service as soon as the station puts in fiber, so I may have some first hand experience soon. You can ID the link by just injecting a MCW repeater IDer on a 10 minute timer. It'll cause a few retries while it runs, but who cares?

Thanks Richard for the comeback...after a call to Kantronics, I got GMON working
very nicely. The MONITOR ON and INVERT play a role in how GMON copies...
unfortunately, a lot of these shareware programs mess up the KAM settings...
(monitor was turned off) ;-)

Anyway, GMON works quite well...certainly better than the software version
and also runs quite nicely on an old PS/2 8086 machines.
Now if only there were more GTOR stations on the air ;-)

73s,
Doug.

Stan, I appreciate that you're trying to make a buck by plugging your
program on Internet...but calling the "feature" in your code a Nag-Meter
is an understatement.

Why not tell it like it is? In all actuality, after running your program
for 15 mintues, your program does its very best to try to crash all programs
running and hang the system - leaving only the big-red-switch as an exit.
If you wish to distribute crippleware, figure out a better way of "exiting
gracefully".

Dear Friend,

I'll be the first to admit the previous message sounds too good to be true, but it just might be true for you! You only need to invest $5 in this scheme, so even if it didn't work, the most you could possibly lose is $5. Why not give it a shot?

INSTRUCTIONS

Follow these instructions exactly, and in 20 to 60 days you will have received well over $50,000 cash, to keep! This program has remained because of the honesty and integrity of the participants. Please continue its success by carefully adhering to the instructions.

Your product is not solid and tangible, but rather a service. You are selling recipies.

Many people like to recieve new recipies and this is an easy way to do so.

Easy Steps

1. Immediately mail $1.00 in cash and your favorite recipie to the first 5 names listed below, starting at number 1 up to and including number 5. (Total investment, minus postage is $5.00)

2. Remove the name that appears as number 1 on the list. Move the other 9 names up one position (Number 2 becomes Number 1, Number 3 becomes Number 2, and so on). Place YOUR name, address, and zip code in the number 10 position.

3. With your name in the number 10 position, upload this ENTIRE message to 10 different newsgroups, or print it up and place it in public areas.

4. Within 60 days you will receive a fortune (approx. $50,000) in cash.

Keep a copy of this file for yourself so that you use it again and again whenever you need money. Before you know it, people will be sending you money for your recipie. The list will become more valuable as it grows in size.

This is a service. IT IS PERFECTLY LEGAL. If you have any doubts about the legality of this service, refer to Title 18, Sections 1302 and 1341 of the Postal Lottery Laws.

Note: Do not discard any names or notes sent to you. This is PROOF that you are truly providing a service.

Remember- This program fails only if you are not honest. Please be honorable, and it WILL WORK FOR YOU!

3476. Re: Where is Baycom Ver. 1.6??

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-08-02 00:00:00 UTC
From: Jim Devenport <jdevenport@lanl.gov>
Message-ID: <3vmr59$osr@newshost.lanl.gov>
Source record: 42063

The Digicom modems will work as is, unmodified, in my
experience, on roughly 50% of the PC's in use. I have
never known them to work on Dell clones nor any other PC
requiring "true" RS-232 levels at the serial comport since
the less expensive Digicom modems produce only "half" the
data voltage excursions (one polarity only).
I say go ahead and try it, you may be lucky and it will
work on most of your PC's. The modem will almost always
transmit successfully; if it can not be persuaded to
receive you'll need to add an RS-232 level adapter to it,
such as a MAX232 or such like.
Here's the wiring compatibility chart:

```
25-Pin Com 9-Pin Com C64 Description
*********************************************
20 4 3 TX data
4 7 5 PTT
5 8 4 & 6 Receive data
7 5 1 Ground
*********************************************
```

I've actually wired up a couple modems with both C64 and
PC connectors pigtailed together.... that way I can plug
it into either computer without the usual jumper-clip
shuffle.

Hello there,

We are wondering if there are HIGH SPEED modems available with speeds
UP to 128 kbit/s to be used in a link between two PC's on 23cm/70cm. We want
to transmit a video signal via ax25 packet and make use of two HIGH SPEED
modems. If someone has any experience with HIGH SPEED data exchange via
modems that can be used in packet, or knows where to obtain more information
on this matter, please reply to the following E-mail address:

esrac@stack.urc.tue.nl

>--
> Rich@gate.net

=====
Baycom 1.6 is a commercial program.
It is not freely distributable, and is available from Tigertronics, plus
at least one other commercial distributor of Baycom modems.
=====
The C64 modem might be converted, but with the Baycom modem costing only
$50, I think it is not worth the effort.

Most properly grounded PC's have not presented any problems with RFI EXCEPT for an IBM laptop with an external diskette drive...this puppy is so noisy you can't copy anything on any HF band when its on...S9+! I've seen situations where the ground was floating on the PC and this caused problems both ways...RF affecting the PC and the PC putting out whistles on some bands.

3483. Perseids packet test

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-08-02 00:00:00 UTC
From: horzepa@gdc.COM
Message-ID: <9508021328.AA03465@mailhost.gdc.com>
Source record: 42070

Here is what we are doing for the Perseids shower. There's not enough time
to get it into QST in time, so please spread the word.

73,

Stan, WA1LOU

NATIONWIDE 2 METER METEOR SHOWER TEST 11-15 AUGUST

The August QST Packet Perspective column by Stan Horzepa pondered
a plan to test 2 meteor scatter. LETS DO IT! Amateurs Nationwide
are hereby encouraged to participate in the Persieds Meteor
Shower which will peak on 13 Aug. Although 6 meters is far better
than 2 meters for meteor scatter work, everyone has a 2 meter radio and
we can make up in numbers what is lacking in performance. All
you need is a TNC, and preferably high power and a beam. The objective is
to see how many grid square (DX) packets you receive over the 4 day event.

Here is the plan: Stations in the four quadrants of the country will
alternately transmit for 15 seconds. Stations will transmit the
shortest possible meaningful packet formed by placing their 6 digit
gridsquare in the UNPROTO TO callsign field. eg, W3ADO>FM18SX: The
suggested frequency is the ARRL experimental packet frequency of 145.79.
BE SURE THIS FREQUENCY IS NOT OTHERWISE ASSIGNED IN YOUR AREA. EVEN so,
you can still monitor!

STEP-BY-STEP SET UP PROCEDURES:

1) Point your beam towards a major population area about 500 to 1000 miles
away in one of the three other USA quadrants. If there is another 2m
local station, coordinate your beam headings so that you are not both
hitting the same azimuth and receiver target area.
2) Enter your grid square into your TNC using the following command:
cmd: UNPROTO FM18SX
(If you cannot estimate the last 2 digits, use AA)
Notice that there is NO VIA DIGIPEATER used!
3) ATTENDED OPERATION: Enter the converse mode (cmd: CONV) and
then each time you hit your carriage return key, you will send a packet.
Hit 20 CR's and you will send a bundle of 20 grid square packets.
Synchronize your clock with WWV and transmit as many CR's you can in
the following schedule:
North East stations transmit between 00 to 14 seconds
South East ... 15 to 29 seconds
South West ... 30 to 44 seconds
North West ... 45 to 59 seconds

4) UNATTENDED OPERATION: This will probably be the most successful:
a) Set your BEACON TEXT to ^HP where H and P are single characters:
H is beam heading divided by 10 and expressed by the digits 0 to 9
and then A through Z. 9=90, A=100, B=110, C=120... Z=350
P is the square root of your power %10. 1=10, 2=40, 3=90... 9=810
b) Set your BEACON to EVERY 1. This is not in accordance with the
scheduled 15 second cycle, but it is better than nothing if you are
operating un-attended.

5) Alternatively, run the APRS program version 71b or later, which has an
automated mode for Meteor Scatter and will plot all received packets on
the map. Also, in many areas, 145.79 is already being used for APRS.
Read the APRS METEOR.txt file.

EXPECTATIONS: Meteor scatter paths are VERY specific between the
transmitter and the receiver, typically any single event will only be
heard by receivers within about a 20 mile footprint. This is why
everyone can transmit at the same time in the same area, preferably
pointing their beams in slightly different directions. As long as
there is about 50 miles between identical TRANSMITTING stations, their
signals will NOT probably hit the same receivers at the same times.

W0RPK and K1HTV did make a successful 2 meter packet contact in 1984 over
about a 1000 mile path, but it took 2.5 hours of constant packets.
Hopefully by having hundreds of transmitters, and hundreds of receivers,
we can improve the statistics. The best time for meteors is in the early
mornings from 0400 to 0800 LOCAL time. But it is not much worse the rest
of the day...

REPORTS: Since you will possibly see packets that no one else will see,
send all gridsquare reports (Only those known to be greater than 250 miles
distant) to me and I will compile the data. Be SURE to include your
gridsquare!

Bob Bruninga, WB4APR @ KA3RFE.MD or
bruninga@greatlakes.nadn.navy.mil (preferred)

P.S. The Naval Academy 40 foot dish (Annapolis MD) will beam towards
Florida on the 11th, Atlanta on the 12th, the midwest on the 13th.
Donno about the final 2 days yet. Expected ranges are only about 550
miles, though, because the elevation cannot get down below 10 degrees.
The range to Atlanta and Indianapolis are about perfect for that...

P.P.S. I had posted a request for everyone to check with their frequency
coordinators to find a permanent 6 meter Meteor scatter (and separate
APRS) frequency. So far NO ONE has responded. All I am asking for is a
copy of YOUR EXISTING PLANS so that we can select minimum grief
frequencies. Here is the current band plan in the Greater Wash DC and
Baltimore areas....

In the absence of any contravening data, for this AUGUST 11 to 15 test,
lets use 50.62 MHz for any APRS 6 meter METEOR SCATTER TESTS..

50.62 packet backbone (defunct) & I have crystals
50.64 avail
50.66 avail
50.68 avail
50.70 rtty freq (probably defunct)
50.72 avail
50.74 avail
50.76 avail
50.78 avail
50.80 bottom edge of radio control band

I suggest the LOWEST and FURTHREST From the radio controllers for 6 meteor METEOR SCATTER WORK. This means 50.62.

Then i suggest 50.78 for APRS...

Some hams in Japan were using 9600 baud fax modems for packet a few years ago (and may still be). A ham in Michigan (I forget the call) did some experiments with this and wrote an article which appeared in PSR probably 3-4 years ago. It is not compatible with the k9ng/g3ruh type modulation, and the training sequence is probably an annoyance, but it works without the need to hack the radio.

1200 Baud packet in Northern Minnesota is on 145.010 Mhz. There is a
digi called MNVIR in Virginia, as I get down there through a few other
digis. If you do 2 hops via MNVIR -> ONRUM -> VE3TKA, there is a BBS
located. I am a Canadian Amateur that uses these digi's quite
frequently. Check 145.010 out and you are guaranteed to find
something.

The ISBN is 0-87259-495-5. The ARRL operates the arrl.org domain.
I don't have an electronic order address for ARRL publications, but
I bet an Email to Debra Jahnke, djahnke@arrl.org, would answer that
question. (What she doesn't know about the operation isn't worth knowing
anyway.) Good book, BTW.

In the Latest QRZ CD-ROM there is a program MUBAYCOM which is intended to be a Baycom Looka alike for use with a normal TNC. I suppose the idea is to make it easier for those who sometime use a normal TNC and sometiems a Baycom type Modem.

>> phone line. That's not packet, but it is digital over radio.
>
>Gary, do you know anyone who is doing that? That would seem to make a

Some time ago I asked the same question and got some positive responses,
but, nobody tried it. I heard from people using modem/fax chips over
packet, and we have some dedicated interlinks running with 9k6 and higher
fax modems here in Germany.
Really interesing would be connecting an 200$ 28k8 modem to a fulldup-
radio for a dedicated link. After some research I think it should be *very*
easy. You're right, the problem is only the hybrid. I found some stuff
from MITEL, they have SLIC's you may use for this purpose.. Or, even
easier, there's a thing called 'circulator' (badly translated from
Germang :), it splits the phone line in the two signals.. only 3 op-amps,
should be in most better electronics books..
You can even get the transformers of old phones or so and use them, that's
the way my old 2k4 modem does it. Phonemodems do echo compensation, very
good.
Cheap modems are maybe not the best choice, they may have problems if
the link quality changes- retrain, fallback, fall-forward and this aren't
very well implemented in some cheap ones.
There you're getting into some ranges where building some FSK capable
TRX with may cheaper as the whole plugn' play setup. Much more cheaper!
And more fun, too :)

>What do you think about 10 mbps point-to-point microwave links? It would
>be interesting to run ethernet over radio, if you programmed an
>appropriate ID setup...

I heard some people did this with modified ATV transceivers.. The problem
is, you need very strong signals. Compare a 25khz 19k2 channel with
10MBit! That's 10MHz bandwidth if you just modulate a gunnplexer without
fiddling with better modulation schemes.. you need a big PA for good
distances :)

There are rumors some people modified NE2000's to a slower datarate
like 2 or 3mb and sending the stuff over a wireless video trx system
on 5ghz (which is available for some 100$ here, no-licensed band).

It only outputs 10mW, good between two buildings, nothing more.

73,
Olaf

>
>Total crashes 3 total time of use on my computer 3 months
>
This doesn't make sense to me, Warp runs faster on my system in most tasks,
I never notice a slowdown when it swaps (barely noticeble in W95) & the only
time I've crashed OS/2 is when I try really hard (haven't been able to crash WARP
without doing something dumb with hardware) or I'm running an unstable beta.

>Windows 95 - ahhhhhhh - says it all!!!! Only crashed once one first

Try running a couple DOS comm programs out different ports & then access
your ethernet with Jnos, computer freezes, both builds, waiting for final code
to see if it still does.

>great reasons (none for me but good reasons)
>2. I have tried both and both, BOTH, HAVE there own good points!
>3. I like people not hate them!
>
I agree that both have their good points & I'm really impressed by W95. Warp is
a pain to install in comparasion for instance. I've only had W95 since the preview
came out. On my machine- 486-66, 20M ram, 4-350+ meg hard drives (1 IDE, 3 SCSI)

Warp works better, W95 can't use the drives as well & wants to swap more. I'll admit this is a lot of machine for either one but the people asking me about W95 have 4M, 250M HDD, W95 won't work for them so I tell them to wait. I feel that if you build a machine to where it runs W95 well you just as well throw Warp on it & not get lost in the "made for W95" mess that's coming. If you can't handle the OS/2 installation (it's not nearly as bad as 2.1 was) then try W95, it is a good upgrade to W3.11. 73

Buy ?

Why buy ?

The original netrom code was sold commercially to amateurs,
but I think software 2000 (?) have stopped supporting it.

There are a number of versions freely available for amateur use
(not available for commercial application)

try

TheNet X-1J4 from ftp.ucsd.edu in the hamradio/packet/tcpip/incoming
directory. Look for the files X1J*.* and hotncold.*

: > Fine, you don't have to learn it.

: I already know it--I was referring to those that have no need to know
: UNIX.

Most things in this world are not truly *needed*. However, our
lives are enhanced by the *habit* of learning, even if you see
no immediate requirement for it. And, if the acquisition of the
knowledge will allow you access to better tools, so that you can
achieve your wants more easily, why not put out the effort?

: >But you'll be missing out
: >on additional power that the system can provide, when compared to
: >the barely-stable functionality of the various incarnations of
: >MS-DOS/Windows.

: This is a gratuitous assertion. It is not borne out by my experience,
: and it is clearly not possible since the OVERWHELMING MAJORITY of
: desktop computers used in business run this software.

Yes, and the OVERWHELMING MAJORITY of help desk problems at the
numerous companies where I've worked and consulted at deal with the
problems associated with the use of an unstable OS and its
applications. Namely, DOS and Windows. I've been out there for
13 years now, and have seen how desktop OS's have evolved from
CP/M to their current state. So no, my observations in real,
working environments are far from "gratuitous assertions." The
major reason for the widespread use of MS/DOS and Windows is

nothing more than inertia, and excellent marketing. When technical
merit is considered, the combination cannot measure up to truly
protected OS's.

: >I'm currently running a fully-connected internet
: >node, AMPR tcp/ip gateway, HTTP server, and acting as a firewall

: >under those conditions. I know, because I've tried.

: >Regardless, XWindows

: . . .the name of the window manager is "X Window", there is no "s". .

Show a little respect for yourself. Attempting to use distractions
to cover up your inability to support your arguments is demeaning. If
you are so concerned about such matters, please note that the product
you are attempting to support is Microsoft Windows. Now did that
add anything?

: > is NOT the OS - it's merely a presentation layer for
: >applications. WinX, on the other hand, proclaims itself as an OS with
: >a standard presentation layer. A subtle, but crucial difference. You
: >can replace X with MGR, et al. if you don't happen to like it. With
: >WindowsX, the most you can do is replace the Program Manager, which
: >is not at all the same thing.

: I run X Window on my Windows NT box, and you can not tell it is not a
: UNIX box. I happen to like Explorer considerably more that X11 or
: OpenWindows in any case.

As I said above, a snazzy presentation layer doesn't make or break
the appropriateness of an OS for a given use. When you are running X on
your NT machine, you still haven't managed to escape the necessity of
running on top of the presentation layer that Microsoft dictates. I have
no argument that NT 3.5 is a perfectly servicible OS.

: >: >though you can make it emulate an Etch-A-Sketch too if you start up X. Unlike
Windoze, Linux
: >: >won't crash because an application went nuts,

: >: Never heard of a kernel panic, eh?

: > No, I've never encountered one with the 1.2.x kernels. I do,
: >however, GPF my Windows machine at work an average of 5-6 times
: >per day,

: Sounds like you need some help configuring your Windows machine, or
: you need some realistic expectations about what your machine is
: capable of.

But you claim below that Windows is a breeze to configure. You can't
have it both ways. As for realistic expectations, I've had to reboot
3 times this morning. In one case, I had the Reflection terminal

software open, and started up MS Word. Immediately after loading my
document, Program Manager GPF'd. Are you claiming that it's unreasonable
to expect that I should be able to even *load* a document while I have
a TCP connection open? In the other two reboots, I was in the midst of
running the Borland C++ 4.5 compiler, with no other tasks running.
Is that too much to ask of a 486/66 with 32MB of memory?

: I use Windows ALL DAY and rarely require rebooting the
: machine, though I am using many large applications. Usually a reboot
: is required because I have installed an ill behaved application to
: test it.

PRECISELY my point. Ill-behaved applications should *NEVER* cause
a reasonable OS to require a reboot. As applications become larger and
larger, they are only going to become more and more ill-behaved. And
if the OS is unable to compensate, it cannnot be considered to be an
appropriate tool for mission-critical tasks. It may "work", but
after factoring in the concrete costs from support requirements, as
well as productivity costs from the interruptions, you end up spending
far more than you should.

: >with the help of your much-vaunted commercial software.
: >Word 6.0, typically, is the immediate cause, as it merrily stomps
: >through other applications descriptor arenas.

: Don't have this problem, myself.

A sample set of 1 isn't significant. We've had to backrev to
previous versions of Word, which have their own problems, to
escape some of the more pernicious bugs. Not a trivial task,
when you have to deal with hundreds or thousands of machines.

: >: >and unlike
: >: >Windoze 95.8, you can actually have more than 4 or 5 tasks
: >: >running at the same time, and they'll actually have some decent
: >: >performance, even on a non-supercharged machine.

: >: Hmmm... last time I checked, my desktop machine running Win95 was
: >: doing everything I needed. My Linux machine, on the other hand, was
: >: sitting idle with a blown-up file system, waiting for me to fix it.

: > I hope you have a good backup, considering that our machines with
: >the Win95 "Golden" beta blew away several filesystems in quick
: >succession.

: I venture to say that you are not the person who actually uses those
: beta Windows 95 machines, because what you are saying is simply not
: the common experience.

Making assumptions will get you into more trouble than its worth. I
am, in fact, the person who uses the machines, and I also have the
job of restoring the filesystems. As for the experience being uncommon,
you might want to peruse some of the Windows groups. The problem

is not as uncommon as you appear to think.

: >When they managed to stay up, of course.

: More gratuitous assertions.

More large-scale experience, in working environments.

: >Pretty sad
: >when you consider that it was running on Compaq machines, which are
: >as standard in the business world as you could ask for,

: Please, you haven't proven a thing, this is gratuitous nonsense.
: Please explain exactly what problems Windows 95 Golden code had with
: Compaq machines--I am sure that Microsoft would be very interested in
: your report.

As I said before, it blows away filesystems on SystemPro machines that use
industry-standard Adaptec 1542 SCSI controllers. And yes, they were
interested. And no, didn't have any solutions for the problem.

: >whereas
: >my home Linux node is performing an order of magnitude more work
: >on a $50.00 Pacific-rim clone motherboard.

: An order of magnitude? Measured how?

In data traffic, if nothing else. The linux node has routed almost
3GB of data without a reboot. Our WindowsX machines could never come
close to that measure.

: Don't obfuscate. Can you get the best selling Windows applications in
: versions that will run under Linux?

: >You may have heard of niche product called "Wordperfect",

: In my opinion Word is far superior to Word Perfect.

: >for example. As for Word 6.0 being a "spectacular" tool, well, I suppose
: >if you want to call an application that regularly trashes its files,

: not here . . .

: >whose filters can often translate less than 50% of a converted file
: >correctly,

: not here . . .

: >and that crashes more often than not,

: This is just plain silly--son't you have any repest for those reading
: this news group?

Again, your professed sample size of one isn't statistically
significant when compared to a sample size of thousands. Please call
again when you have comparable measurements.

3511. Packet program for HP150?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-08-04 00:00:00 UTC
From: greg@core.rose.hp.com
Message-ID: <DCrGEw.JEJ@icon.rose.hp.com>
Source record: 41948

I managed to pick up an HP-150 computer system (the original), with disk and printer. I won't say how much, out of respect for this fine machine.

I'd like to get into packet some day, and thought it'd be a good machine to run it on. The problem is that the 150 is not a complete PC compatible - it's more of a DOS compatible (i.e. if you only use DOS calls, things usually work).

Has anyone used a 150 for packet? I mean, more than using it as a "dumb terminal"? What software did you use, and where can I get a copy of it?

Thanks,

Greg KO6TH

The PA0GRI release usually has the multi-drop KISS stuff in it. Look for the
ATTACH KISS command and follow the instructions. Try ATTACH KISS ? for help.

Here's an extract from the NOSview documentation package:

++

____
attach kiss <existing_asy_interface> <port> <interface> [<mtu>]
____
The 'attach kiss' command enables a multiplexed TNC type to be
used for second channel. It is used to connect a second port to
an already attached 'asy' interface. It will copy most of the
parameters of its parent port.

>> Example: attach kiss tnc0 2 tnc1

ATLANTA BALLOONATICS

Balloon #4 Mission Update as of Aug 4, 1995 at 12:00Z

As you probably know, last Saturday's balloon experiment (carrying a GPS,
packet radio, and ATV camera and transmitter) was postponed due to weather.
It was rescheduled to Saturday August 5th.

Lots of bad weather is still passing through this area due to Hurricane Erin. Many damaging thunderstorms occurred
throughout last night.

A preliminary go/no go decision will be made this afternoon, around lunch time.
I'll try to get the word out here as quickly as possible.

Bill Brown, WB8ELK, is almost a "local" now, living in Huntsville AL and has told us he will be attending this launch.

If you do not have EMAIL access at home, you can get an update from our info line at (404) 936-3737.
The info on there at the moment is very stale, and I probably will not update
it until after 17:00Z. today.

You can find 5.6 GHz data-dedicated transceivers in Germany, available as
kits. They are supposed to run up to 115200 Baud. At this moment, few 76k8 or
28k8 links ar on the air.

Let me know if you need more information, I'll email you the address of the
distributor. Don't forget you'll only get German manuals ;-)

Yes!! It looks like a GO

Atlanta Balloon Update as of 3 August 1995:

All equipment for all packages on hand.
Payloads modules tested. Final integration complete.
Launching from Crossroads, GA. (NW of Dallas)

ATLANTA BALLOONATICS

Balloon #4 Mission Status

DATE/TIME
: Saturday August 4th or Sunday August 5th
: Release 0930EDT (1330Z) 0930EDT (1330Z)
: Weather conditions will control exact time of release

RELEASE SITE:

: Crossroads Elementary School, North of Dallas, GA
WB8ELK (Bill Brown) will be in attendance
: Coordinates 3400.48N 08446.12W

: Payload weight : 2.27kg (5-pounds)
: Balloon : TOTEX TA-1200
: Helium : 180 cu ft.
: Ascent rate : 750 fpm
: Max altitude : 110,000ft
: Max radio range: 640km (400sm)

FREQUENCIES
AND MODES

: Packet Radio Downlink 441.0 MHz 2W
: Retransmitted from ground into APRS net on
145.79 MHz and on 10.151 MHz LSB
: Standard AX.25 1200BPS AFSK FM
: Sending APRS-compatible NMEA-183 GPS navigation data
: No Open digipeating. No receiver. Don't try.

: Altitude & Temperature telemetry on:
146.575 MHz , 28.322 MHz , & 438.5 MHz (wide band TV
audio)

: B&W ATV camera with 1 watt AM transmitter on 434.0 MHz

: All antennas vertically polarized

EXPERIMENTS : More experiments in BASIC stamp control of balloon payloads.
Basic Stamp controlled servo/mirror for multiple camera views.
1 12 bit altimeter and 2 8 bit temperature sensors (inside and outside)
data will be sent as CW on the 10 and 2 meter frequencies

For more details about this project, as well as telemetry decoding charts-

I am pleased to announce a new product offered by Positive Time Systems called the RCS-I. This is a radio controller that connects to any VHF/UHF transceiver and can issue x-10 commands. (X-10 is a power line standard for controlling devices throughout a building. Sears, Radio Shack, and others offer these compatible units)
The unit also has an alarm input, a listen feature, a short voicmail box, and responds to all commands in a pleasant female voice. The system IDs with your recorded voice and call sign. This description doesn't do the product justice, so please check out the new homepage at :

http://www.halcyon.com/pos.time.sys/top

or you may email us with you address so that we can promptly send you our brochure and newsletter.

NOTE: This product is intended for US voltages of 120 / 220 VAC. Another version will be offered to support other international power standards. Email for more information.

Thank You,

Marshall Craw <mcraw@halcyon.com>
Positive Time Systems
North Bend, WA

>
>Does anyone have any suggestions concerning 1) what brands of PC should be
>avoided because of RFI? and 2) how difficult is it to clean up RFI from a
>computer if you do have it? Conversely, what brands of PC's are especially
>QUIET as far as RFI is concerned?

1) Unless it is Tempest certified, they all radiate noise, and it
often varies as much unit to unit as it does brand to brand.
It has more to do with the care with which they are assembled
than it does with the name of the manufacturer on the front.
Especially for no name clones, you are really at the mercy of
the luck of the draw.

Yes, and the Macs are alot better in that respect either.

You missed an important one, Gary. (I'm surprised.)

7) Make sure your modem is well-shielded as well, there's a good chance
there's a fast processor hidden inside. For example, there are
now on the market 28.8 Kb/sec modems with no shielding whatsoever!
(And they even has a "Part 15" stickers on the back...)

Life is tough for those of us without roof access and have to do computing
as well.

Also, watch out for laptops in sensitive applications. For example, you may
be better off going by-guess-and-by-golly aiming at a satellite by hand than
by having a laptop nearby to tell you where to point. Of course, that will
depend both on your radio and your computer.

Have fun.

Art,

I'm going to suggest that this is off topic for the r.r.a.d.m group,
and I'm sure that I'm risking flamage for following up, but since this
is the only question I have read here that I do know the answer to,
I will give the following reply.

I have read that there will be a bug-fix release for Win95 in 1Q96
and that no other major update will be available until 97. This
is also true for Windows NT. There will be a version that adds the
"95" interface to NT in 1Q96, but the next major update will not be
until 97. I hope that answers your question, and doesn't provoke too
many responses that do not relate this back to the topic of digital
radio. By the way, I have some experience with NT 3.5 has anyone
tried running the various NOS programs on NT?

>
>I have a Baycom modem and a Linux. Can this two things work together or
I'll
>have to buy a TNC?
>
>Thanks for you answers!

It seems like you'll either be buying a TNC or a computer to dedicate to the Baycom modem. The way the Baycom modem works demands virtually instant and pretty full attention of the computer it runs on. This is not consistent with what a multi-task operating system is designed to provide. This is because the Baycom modem has no 'smart' processing capability, therefore it's left to the computer to measure the timing for the data coming from the modem (on receive) and to create the timing for the data going to the modem (on transmit). If the computer's processor is busy doing something else, the time involved to switch back to the Baycom driver task will probably be too in excess of the requirement, and the packet will not be decoded or encoded properly. With a multi-task operating system, the chance of the processor being busy elsewhere is high, so much so that your chances of decoding any but maybe the smallest packets are quite small.

Since the folks who write code generally understand the problems imposed by multi-task operating systems, they know the task is pretty hopeless.

Note that I did mention what may be an alternative: Using a dedicated computer. If you were to run the Baycom AX.25 to Ethernet Packet driver simulator software, then load and configure a version of NOS to talk to the packet driver (on one COM port) and to a SLIP link over to the linux box, you might get this to work. I've used the Baycom AX.25 driver described above to run Jnos on a 386sx/20 machine, but have not tried to run a slip link at the same time over to the linux (or any other) computer. But it might work - maybe even with a '286 machine. I've not heard of anyone having luck running the AX25 driver with NOS on an 8088-class system at all, and I know some guys locally that've tried.

Hope this information is useful, and if you get it running with a dedicated computer for the Baycom driver and NOS, I'm sure there are others that would be interested in hearing about it.

Source record: 41969

On August 5th, after a 1 hour weather hold,our balloon was launched from Crossroads Elementary School near Dallas, GA. Bill Brown (WB8ELK) and his girlfriend were there to lend a hand.

We even had an unplanned experiment: "Ants in Space" (with apologies to Gerry Creager's cows). Someone had set the GPS payload down on an anthill, and we were going to have the first amateur "Antronauts". :(

At liftoff, something caused the bottom payload (the GPS/TNC/TEKK Radio) to separate from the flight train.
This caused the balloon to ascend with only the ATV payload, Radar reflector, parachute, and 10 and 2 meter beacons.

Those payloads worked flawlessly, and the fox hunters DF'ed the balloon with the aid of APRS and manual beam
headings, handi finders and Doppler units. A local fellow has a Company (Directional Systems) that makes a NICE Doppler unit.

After a two hour flight, the package landed on a farm, in a 100 ft high Sweet Gum tree. The farmer tried to
shoot down the package for us with a rifle, but couldn't get all the strings. His son finally felled the tree and we cut it up into logs and stacked it for him. The payloads, including the video with servo controlled moving mirror all worked while the balloon was in the tree and during the tree felling.

By the way, the first person to the balloon was WB8ELK. I know telemetry was received in Huntsville by KE4EER.
Any one else receive our beacons?

We'll post some images on the web site soon. And I will post the HST file of the DFing activities as well.

We have 1 balloon and 1 tank of helium left, so we'll fly it again soon (ALL of it, I hope)

For more details about this project, as well as telemetry decoding charts-
see the WWW address listed below

>I'd like to know how APRS is working. I mean, when you have a GPS-TNC in your >car, what do you do ? Do you have to connect to an APRS system to report your >position, or simply send unproto frames ?

If you are running the APRS program on a laptop or other computer in your car, the APRS program sends your position into the network as you move. If your GPS is connected straight to a TNC (with no computer) it is suggested to set the GPS to output a position sentence every few minutes. The TNC is set up in the CONVERSE mode and will transmit the position in a UI frame.

If you have one of the newer TNCs that supports GPS directly, it will have settings that willcause it to hold the position reports and transmit them periodically.

>What's happening if you leave the coverage of your local digipeater ? Is >there a way to set an alternate connect path ?

Yes, you use the U (Unproto) command of APRS to set the path towards your destination.

Most aprs digis here are all on the same frequency: 145.79 They are all aliased as WIDE and some also as RELAY. So if you go into a new area, you can try using WIDE as the path. That way you need not know the call of the digi in that area. They beacon occasionally, so they may pop up on your screen before you get into their coverage area.

>Thanks for any comments about APRS, I'd like to test it, but need to know >more before :-)

There is an APRS mailing list maintained at the TAPR site. It is very informative.

To sign up, send Email to listserv@tapr.org
On the first line, put Subscribe aprssig

I don' t think you have to add anything, but if you don't start getting about 10 messages a day, do it again, putting :

Subscribe aprssig eric bertrem

on the first line. My mind is blank as to the correct way right now.

Check my www page for more APRS info:

While we're discussing noisy computors, does anyone know where I can get
better (from an RFI viewpoint) cases? I had seen a post about a year ago
advertising surplus Tempest certified cases, but it looks like my
experiment with OS/2 did it in.

I need to do a lot of work on my computors to regain a quiet environment,
but I'd like a reasonable place to start from....

I read with interest your article on windows95.
I received my beta copy and installed it over Windows 3.11 for
work-groups.

However it seemed to have a lot of trouble with my Diamond Viperpci
graphic's card.

At boot time it takes as long as 5 min. to get Win95 up and running.

All this time it sits in the Windows Screen (the one with the moving
arrows from right to left) and then finally seems to get there.

I have heard that Windows 95 will not run with the Family of Diamond
graphic's cards.

I wonder if you have heard of this and if so what the fix might be.

I am in a very isolated part of Australia and have no real access to
the Company.

My system is made up of the following:

1) Pentium Platform at 90 Mhz PCI local bus
2) PCI SCSI Hard drive 540 MByte.
3) Sony CPD-1730 Monitor driven by the Diamond Viper PCI graphics
card
4) CD Rom
5) Colorado Tape Unit
6) External Netcomm SmartModem running at 28800 (This is an
Australian made Modem.
7) Creative Labs Soundcard
8) Last but not least a network card.

Under Windows for Work Groups 3.11 the system performs very well
indeed.

But Windows 95 ..... forget it.

I have been toying with purchasing NT but that is very expensive in
this country , about $960.00 Australian Dollars.

Any idea.s about the graphics card ???

>QUIET as far as RFI is concerned?

1) Unless it is Tempest certified, they all radiate noise, and it
often varies as much unit to unit as it does brand to brand.
It has more to do with the care with which they are assembled
than it does with the name of the manufacturer on the front.
Especially for no name clones, you are really at the mercy of
the luck of the draw.

Yes, and the Macs are NOT alot better in that respect either.

You missed an important one, Gary. (I'm surprised.)

7) Make sure your modem is well-shielded as well, there's a good chance
there's a fast processor hidden inside. For example, there are
now on the market 28.8 Kb/sec modems with no shielding whatsoever!
(And they even has a "Part 15" stickers on the back...)

Life is tough for those of us without roof access and have to do computing
as well.

Also, watch out for laptops in sensitive applications. For example, you may
be better off going by-guess-and-by-golly aiming at a satellite by hand than
by having a laptop nearby to tell you where to point. Of course, that will
depend both on your radio and your computer.

Have fun.

The Mac has less than 10% market share in desktop machines, and less than that among amateurs, so I generally don't bother to mention it by name. I did note that the manufacturer's name on the front makes little difference. While we are talking about niche machines, however, I'd note that the Commodore C64 is generally quieter than your run of the mill PC.

3540. UltraPak 3.0 beta available

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-08-07 00:00:00 UTC
From: Tim Kearsley <Tim@cirrus.demon.co.uk>
Message-ID: <807787096snz@cirrus.demon.co.uk>
Source record: 41977

Hi all,
I have just uploaded today (Monday Aug 7th 1995) a beta version of
UltraPak 3.0, the Windows 3.1 terminal software for virtually ALL TNCs.
Version 3.0 has many new features, most significant of which are:

* Personal BBS, allowing forwarding of mail, bulletins etc.
* "Point and click" interface to reading BBS listings on screen
* Automatic appending of signature file to messages
* Much better connect list interface, allowing scripts
* User-definable connect log

There is more, but the best thing is to try it!
The zipped up file set is called upak30b.zip and can be found at
ftp.demon.co.uk in the directory /pub/ham. File size is 557,674 bytes.
The unzipped files occupy about 1.3 Mbytes.
It is a BETA version, so I shall be of course most interested to hear
your comments, criticisms, suggestions.
It normally takes a day to release new uploads at DEMON, so the file
should be available from Tuesday or Wednesday.

Do rotary encoders "go off" after a year or so? Can they be repaired? Do they lose their magnetism or is it just dust which gets inside?

I have a couple of digital radios which can be tuned by a knob, one cheap, one expensive. In both cases, after a year's use, the frequency started to dither around slightly whilst I smoothly turned the knob. I had thought this was due to a brain-damaged chip but now think it must be the rotary encoder.

Many thanks,
Andrew Thomason (andrew@dpmms.cam.ac.uk)

According to my Cirkit catalogue, the Alps low-cost mechanical encoder
has a service life of 10^6 cycles. They cost #8.95 in the UK if that is
what is used in your radios.

They should not. You may have really cheap encoders - mechanical contacts
rather than optical or magnetic design. These can be cleaned if you can
get at them.

The other types should last a long time.

Is there an orginisation that can provide or a device developed by someone that allows a small electronic device to be attached to portable equipment.

The device could be interogated by a hand held or fairly small unit and thus be identified. The need is to take stock of fairly expensive equipment quickly. This equipment is moved from building to building and if such a device exists, then I have a customer in Australia who would be interested in about 250000 of them!

If you can think of a better news group for this advise please let me know.

3549. FlexNet for digipeaters

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-08-07 00:00:00 UTC
From: ebertrem@infracom.gatelink.fr.net
Message-ID: <gate.eTVH0c1w165w@infracom.gatelink.fr.net>
Source record: 41986

```
FlexNet, a solution for digipeaters
===================================

Have you ever heard about RMNC/FlexNet and PC/FlexNet systems ? The first
one runs with 6809 based cards, the second one on any PC compatible
computer (XT or even better 386).

The software has been written by Gunter Jost, DK7WJ @ DB0GV. It has
many interesting capabilities, such as :

. automatic router : no more broadcasts (The Net), no static routing
(Rose / Fpac) ! The whole network is known on any
digipeater and is displayed in DESTINATIONS routes.

. up to 15 radio channels on a PC/FlexNet + 1 used to interface with
programs running on the same computer, as TSR for example.

. any hardware can be used :

. serial 1k2 Baycoms modems
. Centronics 9600 Baud FSK Baycom modems (PAR96)
. BayCom USCC cards (2, 4, or 8 channels, depending on the model)
. Ethernet cards
. Sound Blaster cards
. KISS interface on COM ports (for PC-to-PC links, not for TNCs)
. Texas Instrument DSP kit
. SCC cards (not yet available, but soon)

etc...

If you don't find *your* card, a driver kit is available : you can program
your own interface !

. A "service interface" allows the use of remote DOS commands (sysop only)
and offers a watchdog function : if your PC hangs, it restarts
the digipeater.

. FlexNet uses auto-parameters : Persist, Maxframe and few other parameters
get values according to the trafic on each radio channel.

. User friendly interface : no more "phone numbers" (Rose) or out-of-range
routes :

C W1AAA WA7MMM is enough to connect your friend 500 miles from home!
----- ------
! !------> output digi
!------------> callsign of your correspondent
```

. an IP router should be available soon, but at this moment, IP frames can be sent via the FlexNet network.

There are many other interesting features, but a bulletin wouldn't be long enough :-)) At this moment, I have an English translation of the PC/FLEXNET French documentation (home made, WORD 6 format only).
If you're interested, just send me an email, I'll send it UUEncoded.

I'm also looking for people who help me translating German / French into English, or simply correct my mistakes.

I forgot : FlexNet is FREE, it has no commercial purpose and can only be used on a ham-radio basis.

Vy 73s.

> Andrew Thomason (andrew@dpmms.cam.ac.uk)
>

Rotary encoders come in several different forms...for example;
there are mechanical type that use switch contacts and there are optical
type that use a pair of diodes (RX & TX) and a slotted wheel that
makes/breaks the beam of light from the TX diode to the RX diode.
(Never worked with the magnetic type, not to say they don't exist.)

The mechanical versions are much cheaper than the optical type. These are
subject to oxidization of the contacts and could create bouncing which is
probably what you are experiencing. Short of opening up the encoder
itself and giving it a good cleaning, It might be best to replace it.
Some of them are sealed units where attempting to open them up
results in bastardizing the thing to the state of irrepair.

Vets are using small microchips that can be inserted in horses, dogs etc and
give a digital readout with appropriate microwave interogation equipment.

Yes, rotary encoders are infamous for their poor reliability. I don't
know what makes them fail, I just know I have seen them go out time and
time again.

Hi!

I am an undergraduate student in Electronic Engineering at the University of Stellenbosch in South Africa. For my final year project I have to build a 10Mb/s microwave data link. For this reason I need info on microwave transceivers, most notably Gunn diodes, etc. Unfortunately information is a bit hard to come by so I am turning to the Internet for help...

I am particularly looking for information at Gunn transceivers in the 10 to 11 GHz range. I am quite interested in the NEC ND751AAM Gunn transceiver, but I am unable to reach NEC through the net. Anybody out there know how to contact them, or at least get some info?

Thanks,
Pierre

Pierre,
For some more information on Gunn diode sources and running them at higher
speeds please see my web page:

ftp://col.hp.com/hamradio/packet/n6gn/index.html

To my knowldege, NEC has stopped making the ND751AAM and its companion
24 GHz transceiver. THere are, however, workable substitutes. At
higher speeds I would strongly recommend using something with electronic
tuning rather than trying to bias-push tune. While the non-electronic
tuned transceivers work fine for receiving, they don't have enough
bandwidth to do well at 10 Mbps. I was only able to get about 8 Mbps
out of the ND751s I originally used in my articles.
The Ma/Comm Gunnplexers or other similar devices appear to have plenty of
capability to go to 10 Mbps or faster.

Good luck on your project.

If anyone is intersted in buying a Marconi 2304 modulation meter (AM/FM), they should give this guy a call.

I guess I was thinking I wanted to buy one and the price was pretty steep new. This guy was selling them for $365.00 and I decided to buy one.

If you want one as well (he had 7 more) then give him a call. He is very reliable.

Hi there,

yes, same thing happened with my Kenwood R-5000 which used an optical rotary
encoder. After talking with a local Kenwood dealer here in Munich, that
was disinterested in taking the radio for service, I decided to have a go
at it myself and tracked the problem down to a bad photodetector in the
encoder itself. I was able to replace the detector with a detector removed
from an emitter/detector module of the write protect section of a junked
TEAC floppydrive. I was lucky it also fit mechancally in the R-5000 encoder.
My R-5000's tuning knob has worked perfectly ever since.

Speaking of expensive equipment, the $58,000 HP 8663A is a case in
point. The rotary encoder in that instrument has a relatively high
failure rate. I don't know if the failed ones can be rehabilitated
by cleaning out the dust.

I'm assuming :) you are talking about light coupled encoders. I would have to say that I disagree with the statement that they are not reliable. Some of the most expensive equipment in the world uses them and they work without fail as long as they are kept clean and properly aligned. If designed properly, they won't need alignment, but dust gets on the encoder wheel and the source/target leds and causes problems. Carefully cleaning an encoder wheel will keep it working for many many years. Case in point, check out the FT-2400. It is notorious for encoder wheel problems. The one they replace it with, I've been told, is better sealed so that dust can't get to it as easily.

Actually, optical shaft encoders are noted for their extreme reliability
and long life. About the only things that can harm them is contamination
of the optical surfaces, an electrical surge that blows the LEDs or
phototransistors, or shaft bearing failure. Now unfortunately, some of
the shaft encoders used in amateur equipment are mechanical rather than
optical, and tarnished contacts, and ordinary contact wear, take a rapid
toll.

3569. DAVIS Weather Station/Packet Radio

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-08-09 00:00:00 UTC
From: Len Sanchez <sanch@cloud9.net>
Message-ID: <40aatn$2df@news.cloud9.net>
Source record: 42006

Our Club has just purchased a Davis Weather station to be used at a repeater site and provide weather
data on packet radio to the Office of Emergency Management and National Weather Service.

Davis provides a modem program to connect to the station on the telephone, they do not, however
provide any relevant information on commands to interface to packet.

Any information would be welcome before we start trying to "re-invent the wheel"

Thanks in advance.

Len- The APRS (Automatic Packet Reporting System) will send weather data over packet. Not only that, it will iconize it on a map of your area, the state, the us, or world along with all the other reporting stations.

For a couple of sample screens and an information file, point your Web browser at my site: http://www.mindspring.com/~rwf. There is also a way to download the program there.

Only problem is: Davis is very protective of their protocol. They sell a disk for developers, but will not release the protocol, - so the APRS author cannot support it. Someoneshould really prod them to work with us and stop being so protective! I have 2 of the Peet Brothers WX units and they do nicely.

As a matter of fact- the PEET will plug into a TNC and spurt out data that can be recognized and iconized by APRS WITHOUT having a computer at the WX site!

There is a mailing list for APRS users as well.
To subscribe, send a message to listserv@tapr.org on the first line of the msg, put subscribe aprssig

3571. Introduction of SPG-NEWS

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-08-09 00:00:00 UTC
From: kizawa@sag.bekkoame.or.jp
Message-ID: <40ausk$r9m@fu.bekkoame.or.jp>
Source record: 42008

Hello it is Tomokazu Kizawa(JO1SPG) of the Kanagawa Pref. Yokohama-city
in Japan.
Thank you for getting my message reading.

Today,introduced E-mail system SPG-NEWS for the packet radio network which
I developed.
SPG-NEWS is client software characterized in the operation environment by GUI
which operates on Microsoft Windows.

Each other of mail of RBBS such as F6FBB-TYPE and WORLI-TYPE, e-mail, and
electronic bulletin boards is forwarded.
Moreover, even if the forwarding setting with RBBS is not done, e-mail and
an electronic bulletin board can be automatically read and written in the
auto-pilot mode.
The auto-pilot mode connects with RBBS automatically and reads the message set
beforehand.
The message is automatically transmitted if there is a transmitted message.

Received e-mail and electronic bulletin board can be read in the operation
environment by GUI.
The e-mail which wants to transmit and the content of an electronic bulletin
board can be edited with a built-in text editor.
The address can be easily specified only by specifying the address made a data
base with the mouse.
An environmental setting can be done very easily being possible to do to the
interactive mode.

SPG-NEWS operates by Microsoft Windows (since version 3.1).
SPG-NEWS was developed with FM TOWNS (made by Fujitsu Limited) which was one
of the strongest, exciting multi media personal-computers in Japan. :-)
The development language was done with VisualBasic2.0 (Japanese version).
Of course, it is possible to operate with all machines where Microsoft Windows
runs because it is software for Microsoft Windows.
The operation is confirmed with the interchangeability machine of IBM-PC/AT.

SPG-NEWS is announced by "Ham fair '95" held in the Tokyo international trade
fair hall in Tokyo on August 25 and is distributed in Japan.
To our regret, the one being prepared now is only a Japanese version.
However, because I want to have everybody in the world use SPG-NEWS, the
preparation for an English version is being advanced.
The development environment schedules Windows95 and VisualBasic4.0 (English
version).
SPG-NEWS English version aims at the release in the second quarter of 1996.
Please expect SPG-NEWS.

Moreover, the one of the RBBS type of the mutual forwarding type also
schedules the development though SPG-NEWS is client software.
This is a development code name of WoodStream.
WoodStream is developed in Japan aiming at the beta test release in the third
quarter of 1996.
An English version schedules the release in the first quarter of 1997.

SPG-NEWS is still software of development on the way.
I want to have a lot of persons use SPG-NEWS and get guidance.
My best regards.

Someone asked about using remote ID devices which could be interrogated by RF. I believe that Texas Instruments makes such devices. I have seen them in EE Times,Microwaves and RF, and Wireless Design, but I don't have any recent advertisements. Try calling TI in Dallas.

: by cleaning out the dust.
: Rick Karlquist

The original RPG in that generation and earlier actually used a filament bulb as the light source, I think it was only in the mid 80's that things switched over to LED based rotary pulse generators. I'd moved into prod eng for a few years around that time and had to change everything in production at Queensferry over to the new type.

I had a different problem with one... I wore out the shaft and bush in a prototype instrument doing testing (Spurious hunting) I swear one of my fingers is worn down, too. For the gross-overkill-global-domination class transceiver I keep building bits of, I think I may have to make my own RPG with proper ball races...

The mechanical switch things are definitely bad news. Incidentally, how many people know that genuine Microsoft mice use nasty contact type pulse generators? I keep wearing them out playing Doom.

Cheers

Eduardo,

My PK-96 has been on the air 24 hours a day for about 1 year now. So far no problems it lives in Kiss mode and I operate nothing but TCP / IP packet. I have the battery installed so even if the power goes out, the computer boots NOS and the PK-96 stays in KISS mode so the packet station just returns to the air automatically. I never shut it off, when at work or o\away from home on vacation.

Surprised to hear you are having problems. I am using Win95 build 347 and have had no problems getting it to work with the Diamond Stealth at 1280x1024, In fact Win95 is the only thing that worked with it directly. I had to load drivers to get it to work with Win3.1, but have had absolutely no success getting it to work under OS/2.

I have had the OS/2 guru's at work try to get it up and running, but even they had trouble. They keep on blaming the hardware.

I am interested in your comments since they (Diamond) insited that the drivers for 2.1 should also work with Warp (I have tried 4 versions of OS/2, none have worked properly with this card. It also had a lot of problems with the SCSI devices) I am hoping that no problems will develop with this card under Win 95 (The OS/2 guru's call it Wonder-Win.. It beats me why they find the thing so threatening!)

The configuration is similar to what you indicated (Pentum 90 PCI, 32MB)

I have been using Win95 for a couple of months now and was very impressed with how easy it was to get running. I use it as a basis for an EDA environment and can run Protel (SCH&PCB win V2.8), Specctra (SB Router) and Altera's MaxplusII (EPLD Design) all at the same time without problems. I definately could not do that under Win 3.1 without crashes or running out of system resources!

For some reason your callsign is familiar.... VK3KVW....??

Regards

Bryan Ackerly (VK3YNG)

There are 3 leads on the servos. One is ground, one is power (4 to 6 VDC usually) and one is the pulse input. The standby power is usually only a few mA but up to 1A should be avaialble to operate the motor. 5V logic supplies are generally suitable. Better performance will result if a full 6V is applied.

I believe a positive-going pulse is conventional. The pulse input can be driven from TTL or CMOS logic. The pulse should be 1 to 2 milliseconds in duration, repeated at 20 millisecond intervals. The repetition rate is not too critical but the pulse duration directly controls the servo position. With a 1 ms pulse the shaft will move all the way to one end, 1.5 ms it's in the center, and 2 ms is the other end. While pulses are being applied, internal feedback in the servo will force the shaft to the position demanded by the pulse width. If an external force tries to turn it away from this position, the motor will come on in the opposite direction to turn it back. If no pulses are applied, the shaft will turn freely if forced externally (subject to friction in the gears of course).

For transmission over radio, using conventional "AM" or "FM" (not PCM) systems, the pulses from each control are transmitted sequentially. Inbetween each pulse, a short change in the carrier (drop of carrier for AM, frequency shift for FM) indicates the end of the pulse. The receive counts these and uses the count to determine which servo is presently addressed. Two IC's (made by Signetics?) have been developed to do this for up to 7 channels. Most transmitters contain the 7 channel encoder even if they are only 2 channels, but the less expensive receivers are generally simplified and can't be expanded easily.

How the feedback control in the servo works is really ingenious but mostly only of academic interest so I'll save that for later.

-Mike KD4QDM

3587. Win95 and COM ports.

Newsgroup: rec.radio.amateur.digital.misc

From: ppiercey@nlnet.nf.ca
Message-ID: <40dljv$qcr@coranto.ucs.mun.ca>
Source record: 42024

Hi all, I may be posting to the wrong place, perhaps comp.win95.bugs would be best but I have a bit of trouble with WIN95 and my COM ports and access to my TNCs. I have a PK232 on port 1 and a KPC-9612 on port 2. I run both JNOS and Lan-Link at times and they were working great up until last night when I installed a Beta version of Win95. Neither Lan-Link nor JNOS will access the TNCs. The built-in terminal program does work and is using the same parameters as I had set up in the other programs but no go. Even when I turn the TNCs off and on again, there is no indication on the screen. Lan-Link reports the TNCs not responding. My modem works perfectly on COM 3 but ports 1 and 2 have no success unless using the built-in terminal or outside of Windows.

Am I to try to set the TNCs up as devices or modems? If so, what do I call them? I didn't see AEA or Kantronics under the modems list :)

If anyone with a bit of insight into this has any ideas, it would be greatly appreciated.

TIA and 73.

> This is , in my opinion, a very big disadvantage.

Not necessary : FlexNet developers used to give once their source code. The result was a disaster and caused troubles in the routing system of the whole network, as far as I know :-)

In addition, don't forget PC/FlexNet is available with C or Turbo Pascal interfaces : you can programm whatever you want, from the basic L1 driver, to the most complicated software, running on the same computer. So I really don't think it's a closed system. Of course, compared to TCP/IP, there are limits, but is it the same application ?

Amicalement,

I have been involved for some time in the successful design and construction of a Digital VFO, for a home brew HF receiver. However, it's now time to remove the crystal filter and start designing a variable Digital Filter to follow the mixer stage in the above receiver project. My initial idea is that the incoming frequency will be mixed down to say 50 kcs, passed through an A to D, followed by the digital filter, which will have its bandwidth controlled from an external PC, then through a D to A and into the product detector and audio stages. I can find little published data on such designs and wonder if anybody can help?

Date: 1995-08-11 00:00:00 UTC
From: sysop@chuckbbs.dragon.com
Message-ID: <8AEF382.016D00000C.uuout@chuckbbs.dragon.com>
Source record: 42034

This is a new BBS. It is designed for Amateur Radio.
The Kennehoochee Amateur Radio Club in Marietta Georgia has a conference here.
We have news groups (like this one) available along with an internet E-Mail access.
Any Radio Club in the local
Georgia area(Cartersville,Marietta,Woodstock,Gainesville,Canton, or anyone north of Atlanta that would like to use this BBS as their home address. Contact the Sysop here.
I'll be glad to set up a conference for your club.
With the club conference you have access to all, including internet E-Mail
If interested contact Charlie Corriveau (sysop) voice: 770-592-1615
bbs: 770-928-0186

3601. How to send internet email to packet callsign?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-08-11 00:00:00 UTC
From: neal@halcyon.com
Message-ID: <40gb56$pj1@news.halcyon.com>
Source record: 42035

Hi, I am a non-packet internetter who would like to
exchange email with a friend on packet-radio.. I
know he can telnet etc from his KISS software and
he mumbled someting about FTP and IP's and digipeating
and TNC..

This leads me to believe he should be reachable
via internet email..

How do I send him email? I know his call-sign, thats
about all... Is there a published FAQ about this?

Thanks for any help.
-Neal.

Source record: 42036

In article <40dljv$qcr@coranto.ucs.mun.ca>, ppiercey@nlnet.nf.ca says...

>Hi all, I may be posting to the wrong place, perhaps comp.win95.bugs would be
>best but I have a bit of trouble with WIN95 and my COM ports and access to
>my TNCs.

>Am I to try to set the TNCs up as devices or modems? If so, what do I call them?

Look in the ControlPanel/System/DeviceManager/Ports dialog (MS must really be trying to hide these things!) for the settings for you rserial ports that are NOT conventional modems.

Win95 ports work fine with KaWin ;-)

3603. 95 ARRL Digitial Communications Conference

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-08-11 00:00:00 UTC
From: gjones@teachnet.edb.utexas.edu
Message-ID: <261170.ensmtp@teachnet.edb.utexas.edu>
Source record: 42037

The 1995 ARRL Digital Communications Conference is fast approaching!

Deadline for pre-registration is August 21st (Monday). The TAPR block of rooms expires August 25th...after that - it is on a first come basis. Be sure to tell the hotel that you are in the TAPR block of rooms when making your room reservations.

Registration is starting to pickup and attendance seems to be on track. There is still plenty of room for Dinner and both Workshops.

Added to the schedule will be an HF forum Saturday, chaired by Johan, KC7WW.

American Airlines and some others are currently having another small airfare war -- so check where you are about prices to D/FW. Several has asked about Southwest airlines. Southwest does not fly into D/FW, so individuals using Southwest will need to take a SuperShuttle from Love Field to the Hotel.

TAPR is looking forward to seeing everyone the second weekend in September in Arlington, Texas.

Press Release:
1995 ARRL Digital Communications Conference
September 8-10th, 1995
Arlington, Texas (minutes from DFW airport)

Permission is granted to reprint any or all parts of this press release.

Full text is available on the Internet:
FTP: ftp.tapr.org WWW: hhtp://www.tapr.org/tapr E-Mail: tapr@tapr.org
----

It's that time again! Time to make your travel plans and put the finishing touches on your work for the upcoming 14th Annual ARRL Digital Communications Conference.

The ARRL Digital Communications Conference is an international forum for radio amateurs in digital communications, networking, and related technologies to meet, publish their work, and present new ideas and techniques for discussion. Presenters and attendees will have the opportunity to exchange ideas and learn about recent hardware and software advances, theories, experimental results, and practical applications. The Digital Communication Conference is not just for the digital elite, but for digitally-orientated amateurs of all levels of experience.

The 1995 Digital Communications Conference will be held on September 8-10th, 1995 in Arlington, Texas. Arlington is just minutes away from the Dallas/Ft.

Worth International Airport, which is located in the middle of the country and airfares have never been cheaper for this conveniently-located conference.

Not only is the Digital Communication Conference technically stimulating, it is a weekend of fun for all who have more than a casual interest in any of the ham digital communications modes. This includes BBS operators, networkers, DX-Cluster Sysops, software writers, modem designers, and digital satellite communications enthusiasts. The Digital Communication Conference is for all levels of digital operators. A must conference to attend to get active on a national level. Now, more than ever, amateur radio needs this great meeting of the minds, since it is important that we demonstrate a continued need for the rich frequency allocations we now have by pushing forward and documenting our achievements. The ARRL Digital Communications Conference is one of the few ways to record our accomplishments and challenge each other to do more.

What can you expect during the 14th annual Digital Communications Conference ?

A full day of papers and breakouts on Saturday for the beginner to the advanced amateur digital enthusiast.

Two workshops, one on APRS on Friday and one on making use of the new PCS (Personal Communications Service) technology on Sunday.

A Texas-sized banquet with a Special Guest Speaker.

SIGs (Special Interest Groups) on Saturday following the banquet.

Informal get-togethers throughout the weekend.

A meeting facility that is perfect for this type of meeting.

Vendor area and informal engineering discussions.

Scores of nearby restaurants and entertainment
(Six Flags Over Texas, The Ballpark at Arlington, Wet 'n Wild, golf)

An event at which the most important new developments in amateur digital communications are announced.

Digital 'movers and shakers' from all over the world in attendance.

Plenty of Texas hospitality!

In addition to the presentation of papers on Saturday, two workshops will be held during the conference. On Friday Keith Sproul, WU2Z, will hold a workshop on APRS packet-location software. Keith is the Chair of the TAPR APRS Special Interest Group, developer of the Macintosh version of APRS, and a leader in the area of APRS technology. This is a unique opportunity to gain insight into this fast growing new digital aspect of amateur operations that combines, computers, packet radio, and GPS (Global Positioning Satellites). On Sunday, Dewayne Hendricks, WD8DZP, will conduct a workshop focusing on a survey of Personal Communications Systems and their applications and use in the Amateur Radio Service. Dewayne is an expert in the area of commercial wireless systems, his company Warpspeed Imagineering focuses on wireless Internet. This workshop presents an opportunity to learn how Personal

Communications Technology (handheld and small business wireless systems) can be used in the amateur service.

If you have attended a Digital Communications Conference in the past, just remember back to how much fun it was discussing the latest developments into the wee hours? If you have never been, then make your plans now to attend and find out how much fun these late night discussions can be.

There are few activities where the importance of your participation can be so much fun and important! What a great way to share and renew your enthusiasm for digital amateur radio! Getting together with colleagues from all over the world and bringing each other up to date on your latest work. All this, and more, for an unforgettable weekend of ham radio and digital communications. Make your travel and lodging arrangements now. We hope to see you at the ARRL Digital Communications Conference on September 8-10!

Full information on the conference and hotel information can be obtained by contacting Tucson Amateur Packet Radio, 8987-309 E. Tanque Verde Road, Tucson, AZ 85749-9399. Phone: (817) 383-0000. Fax: (817) 566-2544. Internet: TAPR@TAPR.ORG

Sincerely,
Greg Jones, WD5IVD -- President, Tucson Amateur Packet Radio
Dave Wolf, WO5H -- President, Texas Packet Radio Society

Note: If you need handouts or flyers for meetings, contact TAPR about getting what you need!

Hotel Information
Conference presentations, meetings, and workshops, will be held at the La Quinta Inn and Conference Center, 825 N Watson Road, Arlington, Tx, (800) 531-5900, (817) 640-4142, Fax (817) 649-7864, intersection of I-30 and Texas 360. Rooms rates are $53/single, $58/double, $63/triple, and $85+ for suites. When making reservations with the hotel, be sure to indicate you are attending the conference. Six Flags (larger than Disney Land), the Texas Rangers, and several other attractions are within a few miles of the hotel. If you are planning to stay at the hotel, it is highly recommended that you book your room prior to August 25th, 1995 -- a block of 100 rooms is reserved for Friday and Saturday. The hotel provides transportation to and from D/FW International Airport. You should contact the hotel to arrange airport transportation.

Registration
Contact the TAPR office by Phone, Fax, or e-mail (Internet: tapr@tapr.org) to pre-register or for additional meeting information. MasterCard and VISA accepted.

Digital Communications Conference
==========
. Pre-Registration (before August 21st) $30.00 * _____

. Late Registration or at door $35.00 * ________

* - Conference Registration includes:
Conference Proceedings, Sessions, Meetings, and Lunch.

. Saturday Evening Dinner $17.00 ** ________

** - Dinner, Speaker, Prize Drawing (Limited Space)

Workshops
=========
APRS Workshop, Friday, 4pm - 7pm. Conducted by Keith Sproul, WU2Z

. Pre-Registration (before August 21st) $10.00 ________

. Late Registration or at door $15.00 ________

PCS Workshop, Sunday, 9:00am - 1:00pm. Dewayne Hendricks, WA8DZP
Survey of Personal Communications Systems (PCS) Technologies and their
application and use in the Amateur Radio Service

. Pre-Registration (before August 21st) $10.00 ________

. Late Registration or at door $15.00 ________

Contact TAPR to register for the DCC.

3605. New Ham Radio Tests - Macintosh

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-08-11 00:00:00 UTC
From: john@wd1v.mv.com
Message-ID: <john-1108951712020001@wd1v.mv.com>
Source record: 42039

The new Macintosh Ham Test Simulators are HERE!

Novice Ham Test 5.0 SA.sea
Technician Ham Test 5.0 SA.sea
General Ham Test 5.0 SA.sea
Advanced Ham Test 5.0 SA.sea
Extra Ham Test 5.0 SA.sea

The latest versions feature:

HyperCard 2.3 as a stand-alone application (SA) eliminating
the need to have HyperCard. All you need is a Mac with 4
Meg of memory and version System 7 or greater.

Each version 5 Ham Test Simulator has the latest questions
as prepared by the Question Pool Committee.

Each Ham Test Simulator is FREE OF CHARGE and work the
same way as the originals written by Diana, KC1SP.

You may obtain a Ham Test Simulator by mailing me a *FORMATTED
disk (1 per test) and include a Self Addressed and Stamped disk
mailer for the return.

The Ham Tests are now also available via America On Line.

Each Ham Test Simulator is also bundled with a shareware CW
program called MacMorse 1.4 written by Doug, WB0EON.

Also included are a collection of text files that relate an
interesting variety of ideas about the best way to study CW and
prepare for tests.

If you load these onto file servers where others can gain access
via Internet, please let me know so we can point others in that
direction.

Your comments and suggestions for future versions are always
welcome. Stay in touch and good luck with your next test!

73,

3608. NEW PRODUCT ANNOUNCEMENT: CWAVE

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-08-12 00:00:00 UTC
From: pika@eskimo.com
Message-ID: <DD6sJo.2Cz@eskimo.com>
Source record: 41795
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.misc

Cwave is a utility for Windows. If you have a shortwave radio and a Windows compatible sound card, Cwave will convert Morse Code into readable text, in real-time. No TNC or de-modulator is required.

Precise sampling and filtering of the incoming signal is provided, and the converted text is presented in a convenient text editor.

Cwave is shareware, and is available for file transfer at:
ftp.eskimo.com/u/p/pika/cwave

Thank you.

-Pika Software

>wonder if anybody can help?

There are a couple companies doing this kind of receiver, and I'm sure they consider the work highly proprietary. Ten years ago, I personally did a receiver as you describe with 4 TMS32010's. Quite a project that was. I'm sure I'm still bound by a NDA, but I probably can say that it was a triple conversion design with a final IF of 12.5 Kc and a sampling rate of 50 Kc. With 4 of today's DSP chips you can easily multiply those numbers by 4 (or only use one CPU). I think you would find a 50 Kc IF a bit too much to handle with just one CPU, unless all you did was a filter....

My point being: Why use of an analog product detector? Use a digital product detector. Once you're inside the DSP chip, do the final IF conversion (a sampling rate 4x the IF makes this easy) and then FIR filter the result. While you're at it, might as well put in the AGC algorithm, pasband tuning, adaptive notch, modem, etc....

3611. Windows 95, NAHH! OS/2 YEAH!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-08-12 00:00:00 UTC
From: jdehry@ix.netcom.com
Message-ID: <40hcu0$qp6@ixnews5.ix.netcom.com>
Source record: 41798

I would just like to say that Windows 95 is the same crap repackaged and refurbished as Windows nt, 3.11, etc etc. It still freezes and locks up when doing simple multi-tasking.

OS/2 On the other hand. Rules! It is the best operating system I have had. Alls you have to do is get over the initial installation. E-mail me if you have problems don't give up! And it is pretty much bullet-proof when you get over the new OS-shell language.

remember WINDOWS 95 sucks! Say it with me now. OS/2 Rules. Besides Do you really want to jump on the bandwagon to a crappy operating system?

3617. Frequency Hopping

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-08-12 00:00:00 UTC
From: sakina@icenet.blackice.com.au
Message-ID: <40i962$vfk@styx.uwa.edu.au>
Source record: 41804

Hello ? Tap tap.... Hello ?

I'd really like to get in touch with any Australian (VK) amateur operators who have experimented with, or are operating F/H on HF,VHF or UHF.

I've had success with Frequency Hopping on HF in commercial applications overseas and would like to exchange ideas, protocols etc. with Australian amateurs.

I realise this may be a bit much to ask of 98% of VK ops, but if you're reading this, you have at least ventured beyond the realm of blah blah nets and poking packet.

Please don't reply with 'tut tut, no no ' about Spread Spectrum FH between 3-30 Mhz.

I know this. Many don't. If you don't tell, I won't tell. They'll never know, because they won't hear it. We'll stay 'in band' and it won't be encrypted, if there's ever an investigation.

Who knows, by the time the sunspot cycle starts to bring decent propagation, we may have a simplex working link on (Shock, Horror) HF. ? Even sooner ?

Nothing fancy to begin with, just test the waters.

Note 1. I haven't transmitted S/S F/H on HF in Australia.
Note 2. I don't have the equipment hard wired to do this. It's around the shack, just not connected up.
Note 3. F/H won't go away. It has been used for 20+ years by the military and commercial users.
Note 4. We can get Temporary Approval from the SMA if you're capable but nervous/paranoid.
Note 5. F/H is definitely not for ops who lift the lid off their rig and say:

"My, things are kinda complex in there"

then put all the screws back into place.

Note 6. Ya gotta have a PC, a will to 'make stuff' and a sense of humour.

I'm willing to talk about it, if you are. Let's talk.

Hello friends, thank for reading my letter.
I am planning work with pack sats. I am looking for all reports and
comments about the equipment.
What antenna have I use ? And radio ?
What is the best TNC ? What equipment are hams using for work with
this Oscars birds ?
I have no idea, I dont know rotors, servo-control boards, special circular
polarized antennas and so on.
I hope hear comments and suggestions about it.
Thanks everybody, all the best.
Peace, 73 !

Hi Matthias :)
I just wanted to post the same question.

Look- I think everybody knows pe1chl-net. And everyone knows how stable
it is! Why? It's (was) only maintained by one person who kept track of
everything. If I look into some NOS derivates I can say from my own
experience that most aren't very stable.

In a network with some 100(!) nodes, exchanging vital routing information
like Flexnet-Nodes consitency is the most important thing! You can't
afford people playing with routingtables or internode-communication.
We already have problems with nodes running 'cloned' Flexnet-protocols,
messing up routing information etc..
(Too complicated to explain here, maybe Matthis want to say something about
this.. :)

There was a time when I also thought the binary-only stuff is a big
disadvantage, but with PC-Flexnet and the applications interface you can
write everything you want, only the 'lower' layers cannot be touched.
Very good, IMHO.

Another point- the author is very aware of bugreports, every bug found
is immediately corrected. (my experience for the last 3 years....)

73,
Olaf

>(ozemail returned unknown host to eric's address ?????)

The same here..

The radios are from Ewald Goebel, dk2db. Eisch Elektronic in Ulm sell kits.
It was described in the '7. Frankfurter Packet-Radio-Treffen, 6.7. April
1991'- script.

It's a 6cm converter to 140mhz for RX, you've to use an Oberon RX or
something similar. I don't know if the kits now include it.

For TX you've a 480mhz oscillator (included) x12 to 6cm.

If something changed, please correct me someone.

73,
Olaf

I am contemplating putting a 10m port on my JNOS BBS. Here in Canada we are allowed a bandwidth of 20 KHz on that band, so it would be possible to run 1200 Baud. I would likely place the port on 28.075 or something in that neighbourhood. Is anyone aware of a problem with using 1200 Baud in other countries? Is that frequency used anywhere else?

3624. DRSI DPK-2 Mod for use with Kantronics D4-10

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-08-12 00:00:00 UTC
From: ssampson@icon.net
Message-ID: <ssampson.185.000DB39D@icon.net>
Source record: 41811

Title: DRSI DPK-2 19.2 kbps Modification
Author: Steve Sampson, N5OWK
Date: Public Domain (p) June 1994

The Kantronics D4-10 radio comes equipped with both an Analog and a TTL interface jacks on the back. The Analog port is for speeds up to 9.6 kbps and the TTL port is for 19.2 kbps. This radio has a large bandwidth and is designed to swing +/- 9.6 kHz deviation. A TTL logic 1 gives +9.6 kHz and a logic 0 gives -9.6 kHz deviation. The task then is to provide a serial data stream up to 19.2 kbps maximum to the TTL port.

All TNC-2 clones can be converted to this speed. In fact most are equipped with a switch on the front of the PC board which is used to specify the data rate. These rates vary from 300 to 19200 bps and normally you never touch this because the modem chip onboard only works at 1200 bps. If you purchase a 10 MHz CPU/SIO upgrade then normally these rates are doubled and you can run up to 38400 bps, in which case you will need more radio to operate at that bit rate.

The DRSI DPK-2 was an all-CMOS version of the TNC-2 and was in the $120 price class. DRSI has gone out of the Amateur Radio business. J4 is where an optional header is installed for external modems. This modification doesn't use a header, but does use two points on the header for soldering a wire jumper.

1. Remove cover (4 Philips head screws).
2. Remove battery jumper (disable battery backup).
3. Remove PC board (4 Philips head screws, two hex screws).
To remove the PC board you must remove the hex screws on
the back holding in the DB-9 serial port connector. Also
you should use a screwdriver and slowly push each front
panel LED out of the panel. Once this is done, you can
lift the front and pull out the power and DB-9 jacks from
the rear. Remove the metal DB-9 cover and set it aside.
4. Remove the PC board trace (using a sharp knife) between pins
17 and 18, and 19 and 20.
5. Locate R-18 and C-8 on the board and remove the side going to
J2 (the radio jack on the back).
6. Solder a wire jumper (wire wrap wire is good) from the removed
R-18 side to J4 pin 17, and the C-8 removed side to J4 pin 19.
Do not cross these wires in layout (to minimize cross-talk).
7. Put the metal shield on the DB-9 connector and put the PC
board in the case and slowly push the LED back into position.
8. Replace the battery backup jumper (enable it).
9. Replace cover.

Theory of Operation

Before modification the TNC would only operate 1200 bps AFSK (Audio Frequency Shift Keying) to an FM radio. This modification disables the SIO data from reaching the internal modem and redirects the data out the rear radio jack (J2). It provides a switched bit rate to the rear radio jack using TTL (Transistor-Transistor Logic). The TNC will now only operate with radios that are equipped with TTL data input. The Kantronics D4-10 is a radio of this type. You can also modify any radio to convert TTL to the proper AFSK tones and deviation. For example to be compatible with most packet radio users, your converter should translate TTL to either 1200 Hz or 2200 Hz at 3.0 kHz deviation. Probably a good start would be a BayCom modem installed right into a radio wired to a DB-9 connector for the TNC. But I digress, as the intent of this modification is to use a TNC-2 for 19.2 kbps and the D4-10. By the way, the RF Carrier Detect pin must be used on the radio jack to the D4-10.

Functional Checkout

When I first set up my 9600 modems I spent quite a bit of time working with the deviation setting. It seemed like it took a long time to even get the data to flow across the house. When I converted two TNC-2 modems and plugged them into the D4-10's the result was instant gratification (my lifes goal) and I only had to adjust the Transmit Delay on both TNC's to a point where they both operated without retries. This is truly a plug and go operation. I've used this link over a 2 mile path with success, but a 16 mile path failed. The reason being that my station doesn't have a good RF path (in a hole). I'm not too impressed with the TNC speed, and consider the 10 MHz mod a necessity. The PacComm 10 MHz modification kit should interface without problems.

Good luck,

Steve Sampson

3626. LAWN wireless network

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-08-12 00:00:00 UTC
From: John Weaver <weaver2@crash.cts.com>
Message-ID: <DD7rFL.BAF@crash.cts.com>
Source record: 41813

I just aquired a wireless device called LAWN. It stands for Local Area Wireless Network. Does
anyone have info on what I could use this for. I just have the one, so it makes it pointless to
use for my LAN. Also, I have an ethernet LAN at home, so I don't really need this gizmo for in
house use. I would like to use is for packet radio purposes??? I'm not sure it would even be
useful for that if one were to take a look at the specs. Something peculiar: It is picking up
traffic on its band (in addition to its own becon), so it could be useful. Anything you could
provide about this thing would be neat. It is fairly brand new and it has the software. I use
Linux and was wondering if there is something for it; like TNC style stuff, or just address it
as /dev/cuaX w/slattatch. Just a packet sniffer would be neat.

Here are the specs

* LAWN wireless network by O'neil Communications
* serial interface w/cables for 9pin and 25pin
* frequencies: 902-928 MHZ
* four(4) channels
* max speed: 38400 per channel
* transmit power: 20 miliwatts
* spread-spectrum, multi-point
* range: 100ft indoors 500ft open
* no FCC licence required
* weighs a pound and is the 7x4x2"
* comes with proprietary networking software
* 7k mail box

If anyone wants this, make me an offer I can't refuse. I got it cheap and you could too.

I downloaded and compiled linux 1.3.9.
The ax25 and nr driver is showing up in /proc/net

Question: Now what?

Is there a doc file around somewhere?

How about some pseudo tnc program under linux that allows users to connect out
to the local packet bbs. I have a kiss tnc hanging off com1.

I am guessing that I need to ifconfig then run some sort of linux app.

any URLs with ax25 docs?

thanks in advance,

de ve3pzr.

ps: the conversd is running ok. We are node London.

I don't know why you like to say it, but it is not true. In fact, I
would venture a guess that you have not even used the product, since
what you say is no much at odds with reality.

>OS/2 On the other hand. Rules! It is the best operating system I have
>had. Alls you have to do is get over the initial installation. E-mail
>me if you have problems don't give up! And it is pretty much
>bullet-proof when you get over the new OS-shell language.

It is such a great product that people shouldn't "give up" on the
INSTALLATION? Wow, it must be REALLY great if you have to work that
hard just to get it installed, and from your article it looks like
using it REALLY builds up the old brain muscle there, eh?

I also like the bullet proof part that you can have if you "get over"
the new OS-shell language. I guess you can count me out, with Windows
95 I don't have to "get over" anything, it all works.

>remember WINDOWS 95 sucks! Say it with me now. OS/2 Rules. Besides Do
>you really want to jump on the bandwagon to a crappy operating system?

No, which is why I stay away from rinky dink OSs with infinitesimal
market share like, of, I don't know, say, OS/2.

Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.digital.misc

I am pleased to announce a new product offered by Positive Time Systems called the RCS-I. This is a radio controller that connects to any VHF/UHF transceiver and can issue x-10 commands. (X-10 is a power line standard for controlling devices throughout a building. Sears, Radio Shack, and others offer these compatible units)
The unit also has an alarm input, a listen feature, a short voicmail box, and responds to all commands in a pleasant female voice. The system IDs with your recorded voice and call sign. This description doesn't do the product justice, so please check out the new homepage at :

http://www.halcyon.com/pos.time.sys/top

or you may email us with you address so that we can promptly send you our brochure and newsletter.

NOTE: This product is intended for US voltages of 120 / 220 VAC. Another version is offered to support other international power standards.

FLASH! NEW FEATURE! The RCS-I has a new feature called Secure Access Mode(SAM). When enabled, the access code changes dozens of times per hour, making it virtually impossible to hack into.

Thank You,

Marshall Craw <mcraw@halcyon.com>
Positive Time Systems
North Bend, WA

From what I gather, NT is migrating to a Mach-like microkernel
architecture, as are most *nix implementations, so as to
gain greater platform independence. That won't necessarily
make NT better, of course. It could just add more bloat.
Microsoft OS products are plagued by a backward compatibility
requirement at the shrink wrap executable level that shows
no signs of going away. That has required piling kludge on
top of kludge in an often unstable way. *nix has mostly
avoided that problem by requiring only source code portability.

What about porting it to another hardware / software platform.

Experimenting with software and protocols is part of the amateur
packet radio network. We don't want or need a 100% reliable network.

We are amateurs, remember. We dont want to compete with the national PTT
organisations.

Joop

Really now Jeffrey, comments such as this will afford you little
credibility as an editor in a popular column in a popular magazine.

Now, it is quite easy to see you are strongly biased towards the Windows
platform, and that is fine. Others may be equally biased towards other
platforms, and that is fine too, but this is not the forum for that
discussion.

I have Windows, OS/2, and Linux, on the same machine. Each OS has its own
strong points and weaknesses. I choose which one to boot depending on the
job I need to do. All three can live happily together in my shack.

Let's put an end to this OS bashing now. If you are compelled to continue
on in this line, please take it to an appropriate forum i.e.,
comp.os.*.advocacy.

True ! Too many versions very often means to many different functions... and
sometimes too many bugs :)

> There was a time when I also thought the binary-only stuff is a big
> disadvantage, but with PC-Flexnet and the applications interface you can
> write everything you want, only the 'lower' layers cannot be touched.
> Very good, IMHO.

I've been distributing PC/FlexNet to French BETA-Testers since PC/FlexNet
first came out and find it very user friendly, evolutive, and its router
relegates the older system to a position of secondary importance.

> Another point- the author is very aware of bugreports, every bug found
> is immediately corrected. (my experience for the last 3 years....)

You're right !! Every bug reported by the French testers has always been
corrected in the next upgrade. DK7WJ is very efficient !

So nobody has installation problems with Windoze 95 eh?
Maybe thats because it hasn't been released yet. What about
the 200 windows apps that have problems under '95?

>I also like the bullet proof part that you can have if you "get over"
>the new OS-shell language. I guess you can count me out, with Windows

Funny, Microsoft copied many of the Workplace shell features of OS/2.
Now Windoze 95 works a lot like Warp. I guess OS/2 must be as easy
to learn as windoze.

Rinky dink indeed!

Try running DEBUG from win95 and use the f command to
fill the bottom 64k of ram with FFs. win95 will crash.
Do the same thing with OS/2 in a DOS session....DOS session dies
but OS/2 stays up along with all other DOS and windows sessions!

Your VFAT file system will waste 10% more disk space than
OS/2 HPFS. Thats 100 megs lost on a 1 gig drive! No wonder
windoze users need Stacker. HPFS resists fragmentation. Windoze
users need to purchase defraggers for vfat drives. All in all windoze
is a gold mine for software utility writers.

I'm just getting started in TCP/IP and have a 1200baud port up on 2 meters with my KAM and a HT. I'm looking to put a dual 1200/9600 baud port on the same 2 meter freq with the same radio. I was planning on using a 9612 and an Alinco 1200 radio. Is this possible with this radio/TNC combo? If not any other suggestions?

Actually, Rick, you are essentially correct. My response was
tit-for-tat, I am tired of mindless OS/2 advocacy. Whatever the
merits of OS/2 (they DO exist), it is NOT a replacement for Windows
95. Please don't think that I reject OS/2 unequivocally, I do not.

Only a small experience. I use OS/2 only when forced into it by
proprietary software that requires it. So? What did I say about OS/2
that is not true?

>>>OS/2 On the other hand. Rules! It is the best operating system I have

I am sure that _thousands_ of people have had difficulty installing
Windows 95. But since 400,000 copies of the preview edition have been
distributed, this is a small percentage.

What _about_ the 200 apps that have problems? There are TENS of
THOUSANDS of Windows apps that run fine under Windows 95. THere are
still more applications for Windows then there will ever be for OS/2.

>>I also like the bullet proof part that you can have if you "get over"

Thanks for warning me, I won't do that with debug under Windows 95.
Is that how you get your Word Processing done?

Gee, you mean that FAT is a bad file system? What a shocker! Hey
maybe we should use something like, oh, I don't know, NTFS. I guess
that the defragger that I got with Windows 95 is an illusion and
doesn't really dfrag the drive.

Look, there ARE technical advantages to OS/2--I have never denied
that. But that does not change the fact that Windows is the number
one operating system (also posessing a variety of technical
advantages) and will remain that way. If I need bullet proof I run NT
(which is what you should be comparing OS/2 with--care to try?)

3651. NOS for Windows?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-08-14 00:00:00 UTC
From: N5UHB <fjorozco@academ07.mty.itesm.mx>
Message-ID: <Pine.A32.3.91.950814160851.25615A-100000@academ07.mty.itesm.mx>
Source record: 41838

I guess I'm falling behind here, since I just heard that there are now versions of NOS for windows. I would like to get some information about this new version of NOS, i.e., what's new about it, what are the advantages over the old 'dos' nos, etc.

Also, I am running JNOS v 1.10i right now, and the thing I don't like about it is that every so often it spews out a listing of NODES over the air. I'd like to know how to control this (i.e., what parameter determines how often this list is transmitted).

Thanks in advance for the info and 73 de Luis XE2MXU/N5UHB

I use a CP-1, which is a simpler version of what you have. I've been
using BMKMulty, a program by a British ham. It does CW, RTTY, AMTOR and
Pactor. It costs about $100 for the basic version. It works beautifully
and is well worth the cost, I think, especially when compared with the
cost of a multimode TNC. The CP-1 and CP-100 are better performers on HF
than the do-everything boxes, and the BMKMulty software does a digital
version of "memory ARQ" (building a correct packet from partially damaged
blocks) both on Pactor (standard) and AMTOR (optional "DX" mode).

BMKMulty is available in the US from

Schnedler Systems (AC4IW)
25 Eastwood Rd.
P.O. Box 5964
Asheville, NC 28813
(704) 274-4646

I am not affiliated with Schnedler Systems in any way, just a very happy
customer.

This is a good reason, but I think it is already planned to port PC/FlexNet on a linux platform.

> Experimenting with software and protocols is part of the amateur
> packet radio network. We don't want or need a 100% reliable network.

You don't need a reliable network ? I do !! :-)) See what's happening in France for example : few hams tried to improve the ROSE system and got what they call FPAC : it's an unreliable, full-of-bugs, and slow system. I dont't want this kind of a network : I prefer letting one single om do the job.

Don't forget that PC/FlexNet uses a mere Kernel, and that you can develop your OWN level 1 drivers, your OWN applications. To my mind, it's far from being a closed system :-)

> We are amateurs, remember. We dont want to compete with the national PTT

I am trying to write an assignment for a class. The professor has asked us to answer a few questions on the v.34 or v.fast protocol that is in the news (and modems) lately. I went to our school library and could find nothing. Does anyone have a bit o' info on them for me? The questions are:

What frequencies does it use?
what modulation technique is used?
How many bits are encoded per baud?
Full duplex or half duplex?
What other features are included?

I thank anyone who has taken the time to read my questions and any help is greatly appreciated.

Revision: 2.1 1994/11/01 03:50:23
Posting-Frequency: posted on the 15th of each month

This message describes the rec.radio.amateur.*, rec.radio.cb,
rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet
mailing list counterparts and complements. It is intended to serve as a
guide for the new reader on what to find where. Questions and comments may
be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@admin5.hsc.uth.tmc.edu. This message was last changed on 31 October
1994 to add the discussion of non-Usenet mailing lists and streamline most
of the history discussion, and to change the moderator information for
rec.radio.info.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became
progressively higher. First one by one, and then as part of two
reorganizations, what was once one group became many. In the process,
developments elsewhere on the net were reflected in the groups as they were
created, most notably the change to place all of the ham radio groups in one
hierarchy.

The collection of newsgroups continues to grow as more people join the net,
and as more topics of discussion gain volume, I expect to see more groups be
created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the
notable exception being rec.radio.swap. There are also a few mailing lists
that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them,
and not to the groups that aren't. The whole idea of having different
```

newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

All of the following mailing lists are sponsored to the Boston Amateur Radio Club, as well as some others of local interest. Thanks to N1IST for the information.

qrp-l: This is the qrp mailing list, previously maintained by Bruce Walker at Think.com. It is for discussions about the design, construction, and use of qrp (low power) radios and related equipment.
arrl-ve-list: This is a one-way list, run by Bart Jahnke of the ARRL VEC, for announcements to VEs and VE teams.
w1aw-list: ARRL bulletins, news, and information
newsline-list: Redistribution of Amateur Radio Newsline
letter-list: Redistribution of the ARRL Letter
fox-list: Fox hunting and Radio Direction Finding
fieldorg-l: ARRL field organization discussions
ham-tech: Technical discussions and questions about Amateur Radio
arrl-exam-list: amateur radio license examinations scheduled in the US and in some foreign areas.

To sign up or inquire about these lists, send mail to listserv@netcom.com with the following in the body (subject is ignored) of the message.
<listname> is the name of the list to subscribe to.
To subscribe: subscribe <listname>
To unsubscribe: unsubscribe <listname>
For more information: help
To post (to the two-way lists), send your message to <listname>@netcom.com

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

3660. Help tuning Digital Modes on HF?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-08-15 00:00:00 UTC
From: herbr@netcom.com
Message-ID: <herbrDDBsy1.Eqt@netcom.com>
Source record: 41897

I am looking for some suggestions or a FAQ on methods to tune the various digital modes on HF. I have just purchased a Kantronics KAM PLUS, and the KAM has alittle "tuning aid" of sorts, but this doesn't offer any help in trying to determine if a RTTY signal, for example is using 170, 425, or 850 shift. Now I think I can hear the different between the 170 and the 850, but how do I tell if they are sending 45 baud versus the higher speed 75? Or what doesn ASCII on HF sound like, and how do I tune it?

Or, if I don't want to rely on my ears, how can I tell?

Also for Pactor, AMtor, GTOR, etc? If I am just tuning around and listening, how do I determine what I am listening to, and how to tune it in? IS there an easy way to hook a scope up to the audio output of the receiver, and will this be of any real benefit, compared to the "tuning eye" that comes with the KAM?

Or is there a much better way?

By the way, the Sw I am using is KAGOLD.

I would appriciate any comments and suggestions.

Thanks for your help.

3661. spread spectrum bands and chips

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-08-15 00:00:00 UTC
From: george@cmf.nrl.navy.mil
Message-ID: <GEORGE.95Aug15081626@halibut.cmf.nrl.navy.mil>
Source record: 41898

What are the details on what kind of spread spectrum
experimenting I can do on the three FCC allocated bands
in the US: 902-928 MHz, 2400-2483.5 MHz and 5725-5850 MHz.
Are all three currently open and if so what if any restrictions
are there on details such as allowed codes or radiated power?

Also, what manufacturers are there of spread spectrum chips?
I have data on Stanford Telecom and an Atmel chip. Any others
out there?

Thanks.

-George

>
>73 de VE7MDL ....Erik.

I do not have the band plan in front of me and so cannot give you the exact freqs, but I do know that 10m has both a 300 baud segment and a 1200 baud segment. I believe 28.075 is in the 300 baud segment, so you should probably reconsider that frequency. Maybe someone else can supply the exact numbers, but if memory serves, the 1200 baud segment is somewhere above 28.100.

3667. Re: help psk modem

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-08-15 00:00:00 UTC
From: gary@ke4zv.atl.ga.us
Message-ID: <1995Aug15.150211.23892@ke4zv.atl.ga.us>
Source record: 41904

In article <199508121430.HAA17001@UCSD.EDU> akhmad@idola.net.id writes:
>dear sir,
>I am planning to setting up KISS on HF transceiver to join internet via
>amateur packet radio. please tell me any suggestions about psk modems (its
>price, features, and best buy) and about setting up kiss for HF trans.
>many thanks for help
>YC4JIM, sumatra island.

KISS setup is the same for HF as VHF, IE set the parameters for
adequate keyup delay to handle the radio in use, and set slottime
and p-persist for the channel conditions at the time. The NOSINTRO
book covers all that in sufficient detail.

A PSK modem could give better performance than those typically used,
but you'd need someone on the other end to use one as well. Typical
current practice is to use Bell 103 signalling. That's not very good,
but it is built into most TNCs. Much better modems are possible, but
you have to find someone else to install a matching modem for one
of them to do you any good.

Now, the biggest problem you face is finding someone willing to
act as your internet gateway. Email forwarding isn't too big a
problem, there are several gateway stations who will do that
for you, but getting ftp, telnet, WWW, etc internet service is
going to be a harder nut to crack. (Note that at HF speeds those
services aren't very functional anyway.)

Since Email is about all you can expect from HF, you'd probably
be better to ignore HF packet and use PACTOR, GTOR, or Clover
with a cooperating gateway station instead. HF performance will
be better with any of those methods than with HF packet as it
is presently done. You *can* run TCP/IP over a Clover, PACTOR,
or GTOR link, just as if it were a dedicated telco link, but a
little software foolery is required to make it play. Ignoring
NOS and using Linux's native TCP/IP instead is probably the best
way to do this. Just run slip or PPP over the TOR link. You'll
probably want to run batch uucp on top of TCP/IP due to the vagaries
of propagation anyway rather than trying to keep up a realtime
link to the internet.

>on a linux platform.

Right, there's someone working on it.

>> Experimenting with software and protocols is part of the amateur
>> packet radio network. We don't want or need a 100% reliable network.

Not 100%.. but it's nice if it works. Before FlexNet introduced it's
autorouter everything here was really bad.. We had RMNC's with the
old FlexNet running, without autorouter. The NET/WRONG folks talked
bad about it, because you had to specify the whole path on connect.
It wasn't really that bad, even better than NET/WRONG. At this time
FlexNet even did hop2hop ack.
But you never knew how to connect your friend, you had to hold large
maps with all links and try everything out- if a link failed you were
stuck and had to figure out an alternative route. It took hours!
Maybe our situation in Europe is different from the US- to connect
someone 50km way I've usually to go over 2..8 digipeaters.
We have very small areas covered by user-accesses with dedicated links
on 1.2GHz.

Look at this- I want to connect to a user only 300km from here.
=>d db0hsk
*** DB0HSK (0-0) T=414
*** route: DB0IE DB0ROT DB0EQ DB0KUN DB0SWR DB0ASF DB0GV DB0SHI DB0BID
DB0RWT DB0DOZ-7 DB0DOZ DB0HSK-3 DB0HSK

Do you think this may work with TheNET, without hop2hop ack?
Never! If one of the links break, the message is distributed to the whole
network after only some minutes (remember the dead nodes in TheNET,
staying there for days?), and an alternative route (if possible)
is used.
No active rerouting, though. You get a link failure message and disc.

FlexNET also does ax.25 headercompression on its interlinks, saving
some bytes. If a link breaks (or the IN-QSO) it falls back to normal
ax.25.

FlexNET gives detailed information on your links:

Here's an example from my RMNC running FlexNET
=>p 2
po id td qso usr tifr rifr tkby rkby qty mode links
2 -- 28 4 1 36 35 2 2 92 2400+ DB4UT 0-9 27/22

The qty is % of frames accepted form the other node. Very good to
optimize the hardware, maybe I've to do something, 92 isn't that good :)
The last 27/22 is something like a RTT in 1/10ms (local/remote rtt).
Others are selfexplaining, I think.
It also has an internal trace for every card.
If I want to connect a new radio, I just plug in a new card and that's
it. The biggest RMNC I know has 15 cards, and it still performs good.

>> We are amateurs, remember. We dont want to compete with the national PTT
>> organisations.
>
>Sometimes I wonder when I see all these internet links. What about radio
>links ? ;-)

We're years behind, no chance to compete. They're much more better than
we, the amateurs are, IMHO. I'm talking here hardware..

See the RMNC/FlexNET as a good working box where you can connect all
kinds of modems, terminals.. It's something you want to work if you
need it. My RMNC is now running for over 4 years without any problems,
lockups, resets. Can't even say this about my KISS tnc's.

PC-Flexnet is different, it allows you to build drivers for everything
you want, applications.. It sits like a packetdriver on an interrupt,
waiting for applications. The only thing you can't do yourself is the
ax.25 layer yourself.

If you want to play with ax.25 something different is better, than don't
choose FlexNET..

Don't see this posting as a flame against other systems, everything
has its advantages, and I respect it. I just want to make clear what our
intension is. Maybe the RMNC is useless in the USA. Highspeed-people
there prefer PI2 cards and wa4dsy, here we use RMNC with max. 115k2 KISS
(some bottleneck, maybe) and data-tranceivers (most df9ic-type)
with g3ruh-like FSK modems, all on 23cm. Useraccesses are limited to
9k6/19k2 max. on 70cm or 23cm, very rare 38k4, because of regulations.
(Channels of 25khz/50khz, all channels occupied.. For this the RMNC
suffices very well. But I don't want to see it with 5*115k2 HF links :)

73,
Olaf

Try comp.dcom.modems. The protocol-specs are on the ITU gopher, but
without account you can't get them, they cost money.
If someone knows where to get the protocol specs for free, please
post it here :)

No one uses 4000Hz carrier frequencies (among other reasons, everything
above 4000 Hz would get filtered, so the signal would essentially be
single-sideband ... not inherently bad, not not good with current
modulation schemes.) Nor do any standard modems use 4000baud (4000
signal changes per second).

The carrier frequency isn't really relevant at all -- getting multiple
bauds into one cycle of the carrier is no big deal. (Of course,
getting multiple bauds into one cycle of a 4000Hz carrier is futile
since that would be more than 4000 baud, which won't work on the phone
network). You can change the signal multiple times per cycle with no
problem ... for example, I'm going to invent a new modulation scheme
called v.brettf right here ... it will use a 100 Hz carrier, and offer
3000bits-per-second, and run at 3000 baud (signal changes per second).
This will be strict amplitude modulation - I'll send the signal at 0dD
to represent a 1 bit and -10dB to represent a 0 bit. I'll be changing
the amplitude of the signal 30 times per cycle of the carrier (or once
every 12 degrees). That's OK. There's nothing that says the receiver

had to receive an entire cycle to determine the amplitude of a signal. (A sinusoidal signal in general is amplitude*sine(frequency*time+phase)) ... time can be determined locally, the frequency is known (it's the agreed upon carrier frequency) ... phase and amplitude are the two unknowns (of which the receiver only cares about amplitude) ... so with two samples of the signal, the receives can determine the amplitude of the signal ... thus, is he can sample the signal 60 times per cycle (and this get two samples everytime the signal level changes), he can successfully demodulate the signal). (I don't want to beat this analogy to death, since it describes a modulation system that is not in use anywhere that I know of, but I will point out that in theory, he could demodulate the signal with just 30 samples per cycle, since the phase is a constant and could be determined in advance ... but frequency is neither constant (no transmitter can maintain absolutely zero frequency drift) nor agreed upon in advance (modem specs never require exactly X Hz carriers, because nothing is that accurate -- there is always at least some percentage of error allowed ... but we can model frequency error and drift as a very slow change in phase, and then we can assume that phase is constant over one "baud" (1/30 of a cycle) but not constant over all time ... and if we do that, two samples per baud are both necessary and sufficient to demodulate the signal.)

In all seriousness, the about modulation scheme is completely viable, and is implementable using technology available today. It just won't work over a regular telehpone line. Why? All digital-based signals (i.e. everything that every comes from a modem's modulator) have infinite bandwidth. The signal is then filtered down to a (roughly) 4K bandwidth (by internel filters in the modems and by the phone network). This distorts the signal. The trick is to design a modulation scheme such that, after it is filtered to a 4K bandwidth, enough of the signal remains to be able to demodulate it. That's what's wrong with my proposed modulation scheme. Enough of the signal won't be left after it gets filtered for a demodulator to be able to receive it. But in a lab where I could run over circuits with bandwidths much larger than 4K, it would work fine.

So the carrier frequency is completely irrelevant in terms of theoretical bandwidth limitations. It's just chosen to make everything "work" (As info, V.34 running at 28.8kbps typically uses a carrier of 1959Hz). It's even possible to design a modem that used a 6000Hz "carrier" and run it over regular phone lines, as long as the resultant signal (coming out of the modulator) has enough information in the below-4KHz range.

What the 8Khz sampling rule limits you to is 4000 Signal Changes per second, or 4000 Baud. No one actually goes that high, though ... v.34 at 28.8Kbps is only 3429 baud. (Note: For the rest of this post, I am assuming 28.8KBps V.34 with 3429 baud ... V.34 defines manay data rates other than 28800, and many bauds other than 3429, and, in fact, even defines 28800 KBps at baud rates other than 3429). To get higher data

rates, more than one bit per baud is used. How can this be done? Many ways. If you are using amplitude modulation, instead of having one level represent "1" and another level represent "0", you can define four power levels and have one for "00" another for "01", another for "10" and another for "11". Thus, everytime you change the signal, you sent two bits. This gives you two bits per baud.

This is how 2400, 9600, and 14400 bps modems work ... 2400bps is 600 baud & 4 bits/baud (I think ... it's been a while since I dealt with v.22, though) ... 9600 and 14000 are (definitely) 2400baud and 4 and 6 bits per baud (respectively). They are also all based on Quadrature Amplitude Modulation, which (essentally) uses two carriers at the same frequency (separated by 90 degrees in phase) and varies their amplitude (for 4 bits per baud, you have 4 possible amplitude values, which gives 2bits/carrier/baud*2carriers=4 bits per baud). (Implementation is more complicated than that, but this at least gives you an idea).

v.34 is a lot more complicated ... at the high end, it is 3429bps with 8.4 bits per baud! How can you have fractional bits per baud? ... there are a couple of ways to look at it ... one is that each signal change conveys 9 bits 40% of the time, and 8 bits 60% of the time. Another way is to realize than 8.4 bits/baud is 42 bits every 5 bauds, 2^42 is 4.398*10^12. Since (4.398*10^12)^(1/5)=337.78, all you need to do is provide 338 possible values every signal change. Then the modem just reads 42 bits, and converts the number to base 338.

Neither of these two ways of looking at things is completely right ... The first one (put 8 bits in some bauds, and 9 bits on other bauds) brings up an obvious question: If you are putting 9 bits in some bauds and 8 bits in others, then obviously you have the ability to put 9 bits into a single baud. So ... why not put 9 bits in all of the bauds and get 30861 bits per second. Well, the answer is "it depends" ... depending on the exact details of a modulation scheme, it may or may not be be possible to do that ... remember, the output of the modulator is going to be distorted by the network, and the goal is to have an understandable signal at the other end ... it is conceivable that 9 bits every baud won't work, but 9 for some of the bauds will work. In the case of V.34, the point is moot, since v.34 doesn't switch between 8 and 9 bits per baud.

The second way I gave above doesn't have any obvious flaws. And, in fact, it would be a perfectly viable way of (in theory) doing things. The only problem with it is that it isn't how V.34 actually works.

The way V.34 does it is to realize that 8.4 bits/baud is 67.2 bits every 8 bauds. Thus, they transmit 68bits/8bauds 20% of the time, and 67bits/8bauds 80% of the time. Actually, though, they transmit 68bits/8bauds 100% of the time, and stuff an extra "0" bit into 80% of the "8baud groups" (not really - see below for details). One way of looking at 68bits/8bauds is 2^(68/8)=362.04 (must round up to 363) possible signal levels per baud. There are two issues here: (A) This isn't how v.34 does it -- that is, they don't simply have 363 possible

signal values per baud -- they have a much more complex way of getting 68 bits / 8 bauds, and (B) The question still comes up: If you are going to put 68 bits in every 8 bauds, why can't I use all 68 bits every 8 bauds and get 29142bps (instead of 28800). First, they really run at 29000bps, since V.34 defines a 200bps secondary or control channel. So they use 67.67bits/8 baud (or, 68 bits/8bauds and bit stuff a 0 in 33% of the time) to give 29000bps, then subtract the 200bps control channel to leave 28800 for the user. I suppose if they wanted to allow usage of that extra bit that appears in every third group of 8 bauds, they could, but that would give a very non-standard data rate of 28942bps ... and the percent gain over 28800 would be only 0.5% ... so "why bother"?

This isn't meant to be all inclusive -- If you want gory details, you can get the V.xx specs ... but this gives an idea of how you can cram multiple bits into a baud and how you can have multiple bauds within one cycle of the carrier. Hopefully the above wasn't too confusing :)

Has anyone had the problem of being able to run Amtor with the 940 all ok
but not Pactor? I have this problem and it is due to the fact that the
Transmit/Receive Turn-Around Time of the 940 increases dramatically with
the
longer PTT Key Down time of Pactor. This does not happen with all 940's....

in fact I know of only one other that has the same problem. I would like to
hear
from anyone familiar with this problem. 73.

3674. Re: Windows 95, NAHH! OS/2 YE

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-08-15 00:00:00 UTC
From: timothy.horn@hottips.com
Message-ID: <9508142304091385@hottips.com>
Source record: 41911

SD>I would just like to say that Windows 95 is the same crap repackaged
SD>and refurbished as Windows nt, 3.11, etc etc. It still freezes and
SD>locks up when doing simple multi-tasking.

SD>OS/2 On the other hand. Rules! It is the best operating system I have
SD>had. Alls you have to do is get over the initial installation. E-mail
SD>me if you have problems don't give up! And it is pretty much
SD>bullet-proof when you get over the new OS-shell language.

I'm glad you're happy with Warp. I've been using OS/2 since 2.0. And I've been more than happy with it...I've invested enough in OS/2 applications. But I'm now at the point of shifting to another platform...be it Win95 or Nt. Why? Because I can't connect to my ISP in Warp and getting information from IBM is expensive if not hopeless. And I keep reading about Warpees having problems with the IAK in the various comp.os2 and OS/2 conferences in RIME, Ilink, Intelec, etc. I don't see any such complaints about windows internet programs. Everyone can use Netscape and most web sites are recommending it. And there is a plethora of good and free internet apps whereas OS/2 apps can be expensive.

I've loaded Win95 (June beta release) and its installation program puts Warp's install to shame. If it hadn't failed to install the telesystems network driver (whatever that is) which prevented my internet software dialer to work, I'd have switched by now. As it is, I boot from Warp to wfwg3.11 to run my ISP software (Total Access from Earthlink), grab the USENET newsgroups I subscribe to in FreeAgent and head back to Warp to read them in winos2. TotalAccess and Netscape will not work in winos2. And Earthlink does not support OS/2 having lost the only employee who was familiar with Warp.

I've reinstalled twice now starting with the original IAK. That had no problem dialing Advantis. But who wants to go broke using Advantis? So I tried the slippm dial other provider route. It dials but fails to negotiate a complete link. I installed the latest ppp.zip from Hobbes and it won't even start dialing.

If you're the guru, perhaps you can dicipher these 32bit addresses with respect to the IAK notebook pages:

IP Address: 206.43.133.81
Gateway : 198.68.160.1
Subnet Mask 255.255.255.0
DNS Address 198.68.160.2

Perhaps I put them in the wrong slots. Maybe not. Someone suggested there is a TCP/IP update in addition to the ppp.zip file I downloaded.

He failed to indicate what file name this might be on Hobbes or elsewhere.

For the vast majority of home computer users, Win95 will be a superb multitasker. Most of us do not perform heavy duty background operations. Win95 does do background communications work very well according to most of those doing serious beta work. I can download large zip files in Wincomm using wfwg3.11 while working in the foreground with other windows apps without losing characters or otherwise botching the download. And from all accounts, Win95 is somewhat better than wfwg wrt multitasking. So windows isn't that bad for most folks. It's not as good as Warp. But it does the job.

Any suggestions will be appreciated. Regards, tbh.

3675. Help needed from a newbe !

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-08-16 00:00:00 UTC
From: lonewolf@athena.compulink.gr
Message-ID: <40sfil$ois@news.compulink.gr>
Source record: 41912

OK thanks for your time reading this message but since I am new
to the word of Ham Radio I really need some help !
To be honest I do not know WHERE to start...
I own a 486DX/33 with 8MB RAM (soon 16) and running Linux + DOS - Win3.1
but most of the time I am in Linux.
Reading through the HAM-HOWTO I found on a Linux ftp server I saw
all the neccessary software for the communications (AX.25, satelite
tracking software, etc) but there was no mentioning about the HARDWARE
needed ! Then a packet.faq fell into my hand but that was seriously
outdated (1993 !) so here I am asking you :
What do HARDWARE do I need to get me started with packet radio
communications ? (please be as clear as you can) and how much the cost
will be ?
As you can probably guess I do not live in USA but in Europe,
Greece. What's the experience with this kind of telecommunications on
this side of the Atlantic ?
Does packet radio offer direct connection to the Internet or not
? I mean E-mail, USENET, FTP, TELNET, WWW, etc ? What are the speeds
like ?

Thanks very much for your time,
Costas Vlassis (lonewolf@compulink.gr)

>INSTALLATION? Wow, it must be REALLY great if you have to work that
>hard just to get it installed, and from your article it looks like
>using it REALLY builds up the old brain muscle there, eh?

yes. they should. most people don't have the widely heralded installation problems either, but some do. win/95 is showing some of the same traits in the at work test beds. both os/2 and win/95 install best on no-name clones so far. get a "name" computer and there seems to be no end of things that are squirrelly.

>I also like the bullet proof part that you can have if you "get over"
>the new OS-shell language. I guess you can count me out, with Windows
>95 I don't have to "get over" anything, it all works.

what "shell" language? the commands for os/2 are very much the same as plain old dos. REXX is a much better language for batch files (just as things such as DEC DCL are...)

"it all works" just means you haven't found what doesn't yet. when even the big mags talk of major applications that will have problems with the new order from microsoft, such broad statements must be discounted.

used to be a saying that the only working programs are trivial.

>No, which is why I stay away from rinky dink OSs with infinitesimal
>market share like, of, I don't know, say, OS/2.

turn in your bank machine card. odds are the system under it is OS/2. OS/2 ain't going away just yet. even the Betamax isn't dead.

joopv@etprs.seas.ucla.edu writes:

> this software is only available in executable - no source code.

AG-Funkamateure-THD (dg8y@hrzpub.th-darmstadt.de) replies:

> So what, in your opinion, would be the advantage of
> having the source?

Well, here are a few generic answers to that question:

o Fix bugs; sure, the author's track record to date may be very
good, but what happens in the future if more pressing issues
take priority?

o Add enhancements; compare the fuctionality of KA9Q's original
NOS to the various derivatives currently available.

o Improve performance; there are a lot of folks out there with
a lot of experience in link- and network-layer protocols who
might have some good ideas to contribute.

o Education; somebody might actually *learn* something by being
able to see how the application works.

o Port to new environments; I run Linux -- can I get binaries?

Not to mention a very basic motivation for most hams: the desire to tinker.
Most "conventional" hams want to be able to open up their rigs and twiddle
what's inside; why should "digital" hams be any different? I'll readily
admit to being an "appliance operator" for a when it comes to the hardware,
(isn't it against the law in several states for a software engineer to even
own a soldering iron?), but if I can't tinker with my packet software, I
really have very little interest in it. I thought experimentation was what
ham radio was supposed to be all about in the first place.

As case studies, Linux and GNU serve as excellent arguments for freely
available source code. Would anyone be running Linus Tovalds' kernel today
if he had only released it in binary form? Would the GNU C compiler run on
MS-DOS today if the original implementation hadn't been released as source?

One more point (just to fan the the flames, he said with an impish grin):
although I am thoroughly unfamiliar with FlexNet, I would hazard to say that
if one node running poorly modified code can bring the whole network to its
knees, then the protocol it employs leaves a great deal to be desired. Who
knows, maybe one of those folks interested in obtaining the source code might
have some good ideas about how to make it a bit more robust.

FWIF, another country heard from.... ;-)

I have been running OS/2 from v2.1 and Windows from v3.0 (currently
using Windows '95) and I must agree that OS/2 is a superior product in
many ways, but you will need to present your case with a little more
tact to get an audience with the masses. Just bagging Windows is
counter-productive at best, and you can't get around the fact that the
vast majority of softare packages have been written for the Windows
platform and so it is an easy and viable choice for nearly everyone.

You'll have to do better than that.

Cheers,
Brad

From: Bob Vaughan <techie>
Message-ID: <40sbfo$e5m@nntp.Stanford.EDU>
Source record: 41921

It can't be done..
The basic problem is that the modern 1200bps modems are of the Bell 212
type, where modems for packet are Bell 202 (different modem protocol)..
The main reason that packet uses 202 is that they were available cheaply
as obsolete landline modems at the time that packet was first being developed..

The Bell 202 modems were half duplex, where the Bell 212 modems are full
duplex,
and they also use a different set of tones..

Best bet: go out and buy a inexpensive TNC, or build a Baycomm modem..

That shows.

>What _about_ the 200 apps that have problems? There are TENS of
>THOUSANDS of Windows apps that run fine under Windows 95. THere are
>still more applications for Windows then there will ever be for OS/2.

That would be funny if it didn't reinforce your answer above. OS/2
runs Windows apps just fine, better than Windows in most cases, so
there are actually *more* OS/2 apps available than apps for Windows.
OS/2 is a better platform for running Windows apps than Windows 95,
and much better than Windows itself. Windows 95 specific apps are
a different matter, of course, but they are as yet few in number
compared to OS/2 specific apps.

Sounds like there is not a lot of interest based on the overwhelming
response to your posting. Maybe we can get something going here.

I think there is the possibility of something interesting being built out
of the commercial networking products that are being developed.

In December 93, W7SX gave a presentation to our company club on the
potential application of the Plessy DE6003 2.4GHz SS tranciever to an
amateur digital network at 625 Kbps. At the time he was an engineer at
Plessey in Scotts Valley. Had done his homework, but apparently didn't
get enough started to gain momentum. Looked real neat to me. 625Kbps
would make ISDN look sick. Don't know where W7SX is now.

In March of this year I had a reply from someone at Thorne EMI CRL who
gave me some information on a RS-485 serial interface tranciever they have
developed operating at 2.45GHz and capable of up to 1Mbps. It conformed to
European Standard ETS 300 328. Price was given as 488 UK pounds sterling
(ex vat) in quantities 1 - 10.

With gain antennas these types of units could be good for several
kilometers point-to-point. There is a possibility, if you get enough
players, of putting together a fairly high performance network. How about
TCP/IP nodes linked at up to T1 speeds with lower speed, say 56Kbps, nodes
off of them?

Hi all, I have an early version of L2PCX (test version of 30 May 1995) which is designed to run a simple 9k6 modem through the serial port of an IBM-PC.

Unfortunately it has some problems & I would like to contact the author direct so I can pass on some information that may be of use in any later version. If anyone has an E-mail address for the author, who appears to be located in Austria, then could you let me know please?

Alternatively if anyone is aware of a version later than what I have then I would appreciate a note as to where it might be obtained...

Thanks, de Luke ZL2JF (@ZL2JF.#80.NZL.OC).

What are you trying to do here, Rick? Inject an element of rationality into this debate? Just who the heck do you think you are?!

> I have Windows, OS/2, and Linux, on the same machine.

As a developer, I have a clear preference for UNIX, and I think Linux is the greatest thing since peanut butter. I haven't worked on OS/2 since release 1.1, which was quite incomplete (not to mention buggy as hell) but it featured a very nice API. I find the MS-Windows family of APIs to be ugly, quirky, inconsistent, and the most difficult of the three with which to become proficient. Fortunately, as middleware products become more mature and affordable hardware becomes more powerful, these issues are becoming more and more academic.

As a user, there's no doubt that the MS-Windows environment offers the widest selection of application software today, and will probably continue to do so for the foreseeable future. IMHO its level of application integration and interoperation runs rings around the other two environments.

Which is the "best" operating system? Beats me. Which is the superior color: crimson, magenta, or chartreuse?

> Let's put an end to this OS bashing now.

Watch it, Rick; suggestions like this could get you thrown off Usenet. ;-)

Gary Coffman (gary@ke4zv.atl.ga.us) replies:

> From what I gather, NT is migrating to a Mach-like microkernel
> architecture

Just prior to the original release of NT, someone wrote a book about its development (similar in concept to "Soul of a New Machine".) If I recall correctly, the engineering project manager came from DEC, where he had been responsible for the development of a Mach-based microkernel. When DEC killed the project, Microsoft signed this guy up almost overnight, along with a large portion of the development team. To say that NT is UNIX is certainly an overstatement, but they undoubtedly share some common roots.

3695. TAPR Information

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-08-17 00:00:00 UTC
From: gjones@teachnet.edb.utexas.edu
Message-ID: <275456.ensmtp@teachnet.edb.utexas.edu>
Source record: 41932

Greetings from TAPR!

TAPR can be reached via the Internet. The Automated Information Server that TAPR provides allows anyone to request information on TAPR, products, newsletters, and lots of other files. To find out more about this service, send an e-mail message to listserv@tapr.org with the subject line "Request" and the following text in the body of the message:

help (for a brief set of instructions)
index -all (for a list of all file by topic area)
list (for a list of TAPR Mail Groups)
get tapr taprinfo.txt (or info on TAPR)

In the above message example, "help" retrieves a brief set of instructions for info, "index -all" retrieves a list of available files by topic and "taprinfo.txt" retrieves a text file containing information on TAPR and what TAPR is all about. If you want to retrieve several text files with one message, use a separate line for each "get filename" request.

TAPR FTP

The TAPR Software Library is now available via anonymous FTP. You can access the library by ftp access to 'ftp.tapr.org' in the directory /tapr. Login in as 'anonymous', with a password of 'your_account@internet_address'.

TAPR World-Wide-Web

The series is accesible through the URL:

http://www.tapr.org

What's here? Lots of information about TAPR and digital communications. A page of links (the Home Page), a page of Packet Pioneers and Contacts, a hypertext packet primer and FAQ, ability to subscribe to TAPR SIGs, and more.

Special Interest Groups

TAPR maintains several SIGs in various areas. To get the latest list of SIG groups, send an e-mail message to listserv@tapr.org with the subject line "Request" and the following text in the body of the message:

list (for list of mail groups on TAPR.ORG)

To request the information on any mail group, send an e-mail message to listserv@tapr.org and in the message text include:

information listname (where listname is the name of the mail group)

When you are ready to subscribe, send e-mail to listserv@tapr.org with the following command in the message text:

subscribe <list> <your name>

List should be the name of the mail list you want to join and Your Name should be both your First and Last Name.

Current SIGs include:
NETSIG Regional Networking SIG
BBSSIG BBS SIG
HFSIG SIG on HF Digital Topics
DSP-93 SIG for those that are building TAPR/AMSAT DSP-93 kits
APRSSIG SIG on APRS
TAPR-TNC SIG on TNC Technology

General Information:

* Ever heard of a TNC ?

* Interested in general packet radio information?

* Interested in high-speed packet operations?

* Interested in other types of digital communications?

* Interested in experimenting or building kits?

* Interested in keeping up-to-date on national digital and packet issues?

Then you might be interested in TAPR!

Goals:

% Support Research and Development efforts in the area of amateur digital communications

% Disseminate information on packet and digital communications

% Provide affordable and useful kits for experimenters and hobbyists

% Pursue and help advance the amateur art of communications through publications, meetings, and standards

History:

If you have used a packet radio TNC, then you are already a part of TAPR history.

The TNC (Terminal Node Controller) project grew from a discussion in October of 1981 at a meeting of the Tucson Chapter of the IEEE Computer Society. A week later, six of the attendees gathered and discussed the feasibility of developing a Terminal Node Controller that would be complete and available to amateurs at a modest cost. This was the genesis of TAPR.

On June 26th 1982, Lyle Johnson, WA7GXD, and Den Connors, KD2S, initiated a packet contact with the first TAPR unit. The project progressed from these first prototype units to the TNC-1 and then finally to the TNC-2 which is now the basis for most amateur packet operations worldwide.

TAPR was founded in 1982 as a national organization with interests in the areas of packet and digital communications. Today, TAPR continues as a membership supported non-profit amateur research and development organization. TAPR currently has more than 2000 members, worldwide. TAPR continues to develop kits for the amateur community and is working actively on publications and communications standards.

Membership:

Membership in TAPR includes a subscription to the quarterly published Packet Status Register newsletter. PSR has been published since 1982 and is recognized as an authoritative source for up-to-date user and technical information on packet radio. Much of the material in PSR is timeless. Back issues may be obtained from the TAPR office. Membership in TAPR is $15 for one year. In Canada and Mexico membership is $18 and outside North America they are $25.

Join the amateur digital-revolution -- Join TAPR!

Be sure to try the HAMCOM program. It does a fairly good job(on strong
singal). It uses an opamp camparator circuit. Should cost you way less
than $5(us) even if you have to buy everything. It will also work with
JVFAX.(a great wefax program).
You should be able to snag them off the oakland ftp site. I think the
ARRL ftp site has them.
Good luck

>on a linux platform.

Right, there's someone working on it.

>> Experimenting with software and protocols is part of the amateur
>> packet radio network. We don't want or need a 100% reliable network.

Not 100%.. but it's nice if it works. Before FlexNet introduced it's
autorouter everything here was really bad.. We had RMNC's with the
old FlexNet running, without autorouter. The NET/WRONG folks talked
bad about it, because you had to specify the whole path on connect.
It wasn't really that bad, even better than NET/WRONG. At this time
FlexNet even did hop2hop ack.
But you never knew how to connect your friend, you had to hold large
maps with all links and try everything out- if a link failed you were
stuck and had to figure out an alternative route. It took hours!
Maybe our situation in Europe is different from the US- to connect
someone 50km way I've usually to go over 2..8 digipeaters.
We have very small areas covered by user-accesses with dedicated links
on 1.2GHz.

Look at this- I want to connect to a user only 300km from here.
=>d db0hsk
*** DB0HSK (0-0) T=414
*** route: DB0IE DB0ROT DB0EQ DB0KUN DB0SWR DB0ASF DB0GV DB0SHI DB0BID
DB0RWT DB0DOZ-7 DB0DOZ DB0HSK-3 DB0HSK

Do you think this may work with TheNET, without hop2hop ack?
Never! If one of the links break, the message is distributed to the whole
network after only some minutes (remember the dead nodes in TheNET,
staying there for days?), and an alternative route (if possible)
is used.
No active rerouting, though. You get a link failure message and disc.

FlexNET also does ax.25 headercompression on its interlinks, saving
some bytes. If a link breaks (or the IN-QSO) it falls back to normal
ax.25.

FlexNET gives detailed information on your links:

Here's an example from my RMNC running FlexNET
=>p 2
po id td qso usr tifr rifr tkby rkby qty mode links
2 -- 28 4 1 36 35 2 2 92 2400+ DB4UT 0-9 27/22

The qty is % of frames accepted form the other node. Very good to
optimize the hardware, maybe I've to do something, 92 isn't that good :)
The last 27/22 is something like a RTT in 1/10ms (local/remote rtt).
Others are selfexplaining, I think.
It also has an internal trace for every card.
If I want to connect a new radio, I just plug in a new card and that's
it. The biggest RMNC I know has 15 cards, and it still performs good.

>Sometimes I wonder when I see all these internet links. What about radio
>links ? ;-)

We're years behind, no chance to compete. They're much more better than
we, the amateurs are, IMHO. I'm talking here hardware..

See the RMNC/FlexNET as a good working box where you can connect all
kinds of modems, terminals.. It's something you want to work if you
need it. My RMNC is now running for over 4 years without any problems,
lockups, resets. Can't even say this about my KISS tnc's.

PC-Flexnet is different, it allows you to build drivers for everything
you want, applications.. It sits like a packetdriver on an interrupt,
waiting for applications. The only thing you can't do yourself is the
ax.25 layer yourself.

If you want to play with ax.25 something different is better, than don't
choose FlexNET..

Don't see this posting as a flame against other systems, everything
has its advantages, and I respect it. I just want to make clear what our
intension is. Maybe the RMNC is useless in the USA. Highspeed-people
there prefer PI2 cards and wa4dsy, here we use RMNC with max. 115k2 KISS
(some bottleneck, maybe) and data-tranceivers (most df9ic-type)
with g3ruh-like FSK modems, all on 23cm. Useraccesses are limited to
9k6/19k2 max. on 70cm or 23cm, very rare 38k4, because of regulations.
(Channels of 25khz/50khz, all channels occupied.. For this the RMNC
suffices very well. But I don't want to see it with 5*115k2 HF links :)

73,
Olaf

>many thanks for help
>YC4JIM, sumatra island.

KISS setup is the same for HF as VHF, IE set the parameters for
adequate keyup delay to handle the radio in use, and set slottime
and p-persist for the channel conditions at the time. The NOSINTRO
book covers all that in sufficient detail.

A PSK modem could give better performance than those typically used,
but you'd need someone on the other end to use one as well. Typical
current practice is to use Bell 103 signalling. That's not very good,
but it is built into most TNCs. Much better modems are possible, but
you have to find someone else to install a matching modem for one
of them to do you any good.

Now, the biggest problem you face is finding someone willing to
act as your internet gateway. Email forwarding isn't too big a
problem, there are several gateway stations who will do that
for you, but getting ftp, telnet, WWW, etc internet service is
going to be a harder nut to crack. (Note that at HF speeds those
services aren't very functional anyway.)

Since Email is about all you can expect from HF, you'd probably
be better to ignore HF packet and use PACTOR, GTOR, or Clover
with a cooperating gateway station instead. HF performance will
be better with any of those methods than with HF packet as it
is presently done. You *can* run TCP/IP over a Clover, PACTOR,
or GTOR link, just as if it were a dedicated telco link, but a
little software foolery is required to make it play. Ignoring
NOS and using Linux's native TCP/IP instead is probably the best
way to do this. Just run slip or PPP over the TOR link. You'll
probably want to run batch uucp on top of TCP/IP due to the vagaries
of propagation anyway rather than trying to keep up a realtime
link to the internet.

What are you trying to do here, Rick? Inject an element of rationality into
this debate? Just who the heck do you think you are?!

> I have Windows, OS/2, and Linux, on the same machine.

As a developer, I have a clear preference for UNIX, and I think Linux is the greatest thing since peanut butter. I haven't worked on OS/2 since release 1.1, which was quite incomplete (not to mention buggy as hell) but it featured a very nice API. I find the MS-Windows family of APIs to be ugly, quirky, inconsistent, and the most difficult of the three with which to become proficient. Fortunately, as middleware products become more mature and affordable hardware becomes more powerful, these issues are becoming more and more academic.

As a user, there's no doubt that the MS-Windows environment offers the widest selection of application software today, and will probably continue to do so for the foreseeable future. IMHO its level of application integration and interoperation runs rings around the other two environments.

Which is the "best" operating system? Beats me. Which is the superior color: crimson, magenta, or chartreuse?

> Let's put an end to this OS bashing now.

Watch it, Rick; suggestions like this could get you thrown off Usenet. ;-)

Right, there's someone working on it.

>> Experimenting with software and protocols is part of the amateur
>> packet radio network. We don't want or need a 100% reliable network.

Not 100%.. but it's nice if it works. Before FlexNet introduced it's
autorouter everything here was really bad.. We had RMNC's with the
old FlexNet running, without autorouter. The NET/WRONG folks talked
bad about it, because you had to specify the whole path on connect.
It wasn't really that bad, even better than NET/WRONG. At this time
FlexNet even did hop2hop ack.
But you never knew how to connect your friend, you had to hold large
maps with all links and try everything out- if a link failed you were
stuck and had to figure out an alternative route. It took hours!
Maybe our situation in Europe is different from the US- to connect
someone 50km way I've usually to go over 2..8 digipeaters.
We have very small areas covered by user-accesses with dedicated links
on 1.2GHz.

Look at this- I want to connect to a user only 300km from here.
=>d db0hsk
*** DB0HSK (0-0) T=414
*** route: DB0IE DB0ROT DB0EQ DB0KUN DB0SWR DB0ASF DB0GV DB0SHI DB0BID
DB0RWT DB0DOZ-7 DB0DOZ DB0HSK-3 DB0HSK

Do you think this may work with TheNET, without hop2hop ack?
Never! If one of the links break, the message is distributed to the whole
network after only some minutes (remember the dead nodes in TheNET,
staying there for days?), and an alternative route (if possible)
is used.
No active rerouting, though. You get a link failure message and disc.

FlexNET also does ax.25 headercompression on its interlinks, saving
some bytes. If a link breaks (or the IN-QSO) it falls back to normal
ax.25.

FlexNET gives detailed information on your links:

Here's an example from my RMNC running FlexNET
=>p 2

```
po id td qso usr tifr rifr tkby rkby qty mode links
2 -- 28 4 1 36 35 2 2 92 2400+ DB4UT 0-9 27/22

The qty is % of frames accepted form the other node. Very good to
optimize the hardware, maybe I've to do something, 92 isn't that good :)
The last 27/22 is something like a RTT in 1/10ms (local/remote rtt).
Others are selfexplaining, I think.
It also has an internal trace for every card.
If I want to connect a new radio, I just plug in a new card and that's
it. The biggest RMNC I know has 15 cards, and it still performs good.

>> We are amateurs, remember. We dont want to compete with the national PTT
>> organisations.
>
>Sometimes I wonder when I see all these internet links. What about radio

VK2SG RTTY DX NOTES FOR WEEKENDING 18 AUG 95 (BID RTDX0818)

It was brought to our attention from Syd, VK2SG an
interesting note that this is the 850th set of notes
for the VK2SG RTTY DX Bulletin that started in 1978.
We all Thank you for this fine weekly edition.
God speed, Syd and Thanks for inviting us to assist
you.

Our information this week came from: DJ3IW and
the Cent-Europe DXCluster Node DB0SPC, I5FLN and the
IK5PWJ Packet Cluster, JF1MGI, N2VYU, W2JGR and the
NJ0M node the Twin-Cities DX Packet Cluster and W5KSI.
Thank you all.

Hi all,

I have a MFJ1274 which doesn't include AMTOR and I could like to try out AMTOR as cheaply as possible.

Does anyone have a AMTOR capable controller for sale that I can plug between my computer and HF radio?

MBL hasn't been updated in a long time. The most recent is version 5.14 and
you can ftp it from ftp.tapr.org in /tapr/software_lib/bbs/mbl514.zip

3707. Re: Help tuning Digital Modes on HF?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-08-18 00:00:00 UTC
From: mparkes@aol.com
Message-ID: <411ops$40h@newsbf02.news.aol.com>
Source record: 41844

Hi Herb:

I don't know if I can help you on the different shifts for rrtty...(i never did much rtty, prefer the other digital modes.)

But...as far as amtor, pactor etc goes, here's how to tell the difference:

Amtor is the "fastest" chirp...it sends much shorter bits of information spaced closer together.

Pactor is longer...the chirps or longer in duration and timing is slower.

Gtor is the longest of all...Very long chirps...

Hope this will help. You'll find after a while that you won't be scratchin' your head trying to figure them out. You'll recognize each for what it is. The only area that I still have trouble though is telling the dif between amtor FEC and pactor FEC...sound the same to me...you'll just have to switch between the two modes until the KAM starts deciphering something! (This you'll usually find for other stations calling CQ).

George, what you are talking about is the FFC Rules Part 15 allocations and the respective restrictions and requirements that go will it. In a nutshell, Part 15 allows direct sequence spread spectrum communications under 1 watt transmitted power in the above three bands you mentioned. This being a amateur radio newsgroup, Part 97 rules are very much different, and will be changing in the near future.

I have created an Amateur Spread Spectrum Web page that goes into much more explaination of both Part 15 and 97 rules. I also have details of a STA that you can join to do experimenting beyond the present Part 97 rules. Then there is a biblography page and an other links page (which is quite popular, it is links to other SS info on the Web).

The URL is

http://www.sp.nps.navy.mil/ss

Lastly, on a chip set, look at the Loral (formally UNISYS) PA-100 chip. I was the guest columnist for Harold Price's Digital Communications column in the June QEX. It was an introductory SS article and mentioned the PA-100 chip. I also briefly mentioned PANSAT, a spread spectrum amateur satellite being built at the Naval Postgraduate School in Monterey CA. (http://www.sp.nps.navy.mil/pansat/pansat.html).

Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.digital.misc

I am pleased to announce a new product offered by Positive Time Systems
called the RCS-I. This is a radio controller that connects to any VHF/UHF
transceiver and can issue x-10 commands. (X-10 is a power line standard
for controlling devices throughout a building. Sears, Radio Shack, and
others offer these compatible units)
The unit also has an alarm input, a listen feature, a short voicmail box,
and responds to all commands in a pleasant female voice. The system IDs
with your recorded voice and call sign. This description doesn't do the
product justice, so please check out the new homepage at :

http://www.halcyon.com/pos.time.sys/top

or you may email us with you address so that we can promptly send you
our brochure and newsletter.

NOTE: This product is intended for US voltages of 120 / 220 VAC. Another
version is offered to support other international power standards.

FLASH! NEW FEATURE! The RCS-I has a new feature called Secure Access
Mode(SAM). When enabled, the access code changes dozens of times per
hour, making it virtually impossible to hack into.

Thank You,

Marshall Craw <mcraw@halcyon.com>
Positive Time Systems
North Bend, WA

>Alinco 1200 radio. Is this possible with this radio/TNC combo? If not any
>other suggestions?
>
>Brad Johannes
>KB0HNN

Hi Brad,

First off, don't get the Alinco for 9600 bauds. It doesn't work as advertised. Several months ago QST published a review of radios claiming 9600 baud capability. The Alinco was not among those tested. Not sure why they didn't test it, but in my experience, it's performance would be far poorer than the Icom IC-281. That radio's transmitter had the poorest performance of all of the radios tested in the article. I was at AEA as a customer service rep, and was the in-house expert on 9600-baud operation, having been a 9600 baud user for about 2 years at that point. At AEA we had a service monitor with a digital storage scope built in, and found this a very useful tool in evaluating the low-frequency response of any particular transmitter we were evaluating for operation at 9600 bauds. My recollection is that the Alinco radios, as modified for 9600 baud had poorer low frequency response at their best than the Icom radio did before AEA started helping them to improve on it. I don't think Icom ever really got it as good as an IC-28A that I modified (my 'bench radio') using the informatin in WD6EHR's 9600 baud modification instruction sheet.

The radios we've had the best luck with for 2 meter 9600 baud operations are: GE MVP commercial mobile radios, Icom IC-22S (1977 vintage radios), and Icom multi-mode radios (any model, so far). The Alincos tried here have been a miserable failure. One fellow is trying to use a Kenwood TM-251, but is a long ways away from the 9600 baud two meter repeater that multipath is probably the limiting factor on his success. BTW: that radio looked very good on the service monitor. Another performance factor to consider is the 'keyup' time of the radios. The synthesized rigs made for amateur voice use generally have a keyup time of 150 milliseconds or slower. It's actually possible for a station with a quick transmitter (keyup time < 10 mS) to get a complete packet through to another station while one of the 'slow' radios is still keying up!

For 440 MHz we've had very good success with the Tekk KS-900 radios, but since they were designed for data applications at this rate, it's not a suprise that they work pretty well. They also key up in about 5 mS.

Last comment - because stations operating at one baud rate (1200 vs. 9600) can't reliably detect a transmission at the other baud rate, it's generally a poor plan to put both speeds on the same channel - I tried it for a while, about 3 years ago. If the channel didn't have other users, it worked, to a degree. Definitly not like using a different frequency, preferably in a different band, to avoid desensitization between the radios.

Hope you find this information useful. 73, Bob

From: gbohner@aol.com
Message-ID: <412stv$cb6@newsbf02.news.aol.com>
Source record: 41852

I am a ham cruising the Caribbean by boat (temporarily, I am at home in FL).

I would like to use a packet/Internet Gateway to send Email to non-ham friends and family to keep them informed of our whereabouts. Also, if the gateway was relaiable and timely, I could file a float plan for some of our
more dangerous open-ocean crossings. SInce I am in the Caribbean, I think an
HF gateway might be more practical (what do you think?).

Could you please provide me information on how to access any Internet gateways that you might know about, particularly on HF. Since I just bought
a KAM--Plus and have not yet got my feet wet with packet, I appreciate any suggestions on how to be most successful.

Send mail to GBohner@aol.com. TNX Guy Bohner, W6LJL

So far, so good.

> Given a choice of NT, pick NT, hands down.

Only if you have an unlimited hardware budget. NT requires at least 16 MB of
RAM to deliver anything close to the same performance that OS/2 does in 8.
Further, you don't get anything more than OS/2 delivers.

>DNS Address 198.68.160.2

Your provider is violating a basic rule of IP routing: the gateway must be
on the same network as the system that it's gatewaying from. Some software
doesn't care, but other - and not just the Warp IAK - does. They need to
provide a gateway on the 206.43.133 network.

>For the vast majority of home computer users, Win95 will be a superb
>multitasker.

...until they try to multitask a DOS app or two...Win9x is still fragile in
the presence of DOS apps. and yes, I've tried it on release candidate 6, the
one that supposedly went to manufacturing.

Brad,

I use the FT290RII on packet with a Baycom board. I have had no problems with the setup. Get yourself a regular TNC or a Baycom, hook it up, and get on packet. It was not real hard to hook up. The audio out is available from the mic socket or the headphone jack. I use the headphone jack.

Hope this helps some.

If you manage to get it running successfully, let me know too - I thought
I had it running, but I'm still running the DOS PA0GRI - it's reliable at
least.

John.

>on a linux platform.

Right, there's someone working on it.

>> Experimenting with software and protocols is part of the amateur
>> packet radio network. We don't want or need a 100% reliable network.

Not 100%.. but it's nice if it works. Before FlexNet introduced it's
autorouter everything here was really bad.. We had RMNC's with the
old FlexNet running, without autorouter. The NET/WRONG folks talked
bad about it, because you had to specify the whole path on connect.
It wasn't really that bad, even better than NET/WRONG. At this time
FlexNet even did hop2hop ack.
But you never knew how to connect your friend, you had to hold large
maps with all links and try everything out- if a link failed you were
stuck and had to figure out an alternative route. It took hours!
Maybe our situation in Europe is different from the US- to connect
someone 50km way I've usually to go over 2..8 digipeaters.
We have very small areas covered by user-accesses with dedicated links
on 1.2GHz.

Look at this- I want to connect to a user only 300km from here.
=>d db0hsk
*** DB0HSK (0-0) T=414
*** route: DB0IE DB0ROT DB0EQ DB0KUN DB0SWR DB0ASF DB0GV DB0SHI DB0BID
DB0RWT DB0DOZ-7 DB0DOZ DB0HSK-3 DB0HSK

Do you think this may work with TheNET, without hop2hop ack?
Never! If one of the links break, the message is distributed to the whole
network after only some minutes (remember the dead nodes in TheNET,
staying there for days?), and an alternative route (if possible)
is used.
No active rerouting, though. You get a link failure message and disc.

FlexNET also does ax.25 headercompression on its interlinks, saving
some bytes. If a link breaks (or the IN-QSO) it falls back to normal
ax.25.

FlexNET gives detailed information on your links:

Here's an example from my RMNC running FlexNET
=>p 2
po id td qso usr tifr rifr tkby rkby qty mode links
2 -- 28 4 1 36 35 2 2 92 2400+ DB4UT 0-9 27/22

The qty is % of frames accepted form the other node. Very good to
optimize the hardware, maybe I've to do something, 92 isn't that good :)
The last 27/22 is something like a RTT in 1/10ms (local/remote rtt).
Others are selfexplaining, I think.
It also has an internal trace for every card.
If I want to connect a new radio, I just plug in a new card and that's
it. The biggest RMNC I know has 15 cards, and it still performs good.

>> We are amateurs, remember. We dont want to compete with the national PTT
>> organisations.
>
>Sometimes I wonder when I see all these internet links. What about radio
>links ? ;-)

We're years behind, no chance to compete. They're much more better than
we, the amateurs are, IMHO. I'm talking here hardware..

See the RMNC/FlexNET as a good working box where you can connect all
kinds of modems, terminals.. It's something you want to work if you
need it. My RMNC is now running for over 4 years without any problems,
lockups, resets. Can't even say this about my KISS tnc's.

PC-Flexnet is different, it allows you to build drivers for everything
you want, applications.. It sits like a packetdriver on an interrupt,
waiting for applications. The only thing you can't do yourself is the
ax.25 layer yourself.

If you want to play with ax.25 something different is better, than don't
choose FlexNET..

Don't see this posting as a flame against other systems, everything
has its advantages, and I respect it. I just want to make clear what our
intension is. Maybe the RMNC is useless in the USA. Highspeed-people
there prefer PI2 cards and wa4dsy, here we use RMNC with max. 115k2 KISS
(some bottleneck, maybe) and data-tranceivers (most df9ic-type)
with g3ruh-like FSK modems, all on 23cm. Useraccesses are limited to
9k6/19k2 max. on 70cm or 23cm, very rare 38k4, because of regulations.
(Channels of 25khz/50khz, all channels occupied.. For this the RMNC
suffices very well. But I don't want to see it with 5*115k2 HF links :)

73,
Olaf

Subject: help psk modem

In article <199508121430.HAA17001@UCSD.EDU> akhmad@idola.net.id writes:
>dear sir,
>I am planning to setting up KISS on HF transceiver to join internet via
>amateur packet radio. please tell me any suggestions about psk modems (its
>price, features, and best buy) and about setting up kiss for HF trans.
>many thanks for help
>YC4JIM, sumatra island.

KISS setup is the same for HF as VHF, IE set the parameters for
adequate keyup delay to handle the radio in use, and set slottime
and p-persist for the channel conditions at the time. The NOSINTRO
book covers all that in sufficient detail.

A PSK modem could give better performance than those typically used,
but you'd need someone on the other end to use one as well. Typical
current practice is to use Bell 103 signalling. That's not very good,
but it is built into most TNCs. Much better modems are possible, but
you have to find someone else to install a matching modem for one
of them to do you any good.

Now, the biggest problem you face is finding someone willing to
act as your internet gateway. Email forwarding isn't too big a
problem, there are several gateway stations who will do that
for you, but getting ftp, telnet, WWW, etc internet service is
going to be a harder nut to crack. (Note that at HF speeds those
services aren't very functional anyway.)

Since Email is about all you can expect from HF, you'd probably
be better to ignore HF packet and use PACTOR, GTOR, or Clover
with a cooperating gateway station instead. HF performance will
be better with any of those methods than with HF packet as it

is presently done. You *can* run TCP/IP over a Clover, PACTOR,
or GTOR link, just as if it were a dedicated telco link, but a
little software foolery is required to make it play. Ignoring
NOS and using Linux's native TCP/IP instead is probably the best
way to do this. Just run slip or PPP over the TOR link. You'll
probably want to run batch uucp on top of TCP/IP due to the vagaries
of propagation anyway rather than trying to keep up a realtime
link to the internet.

Actually, Rick, you are essentially correct. My response was
tit-for-tat, I am tired of mindless OS/2 advocacy. Whatever the
merits of OS/2 (they DO exist), it is NOT a replacement for Windows
95. Please don't think that I reject OS/2 unequivocally, I do not.

What are you trying to do here, Rick? Inject an element of rationality into this debate? Just who the heck do you think you are?!

> I have Windows, OS/2, and Linux, on the same machine.

As a developer, I have a clear preference for UNIX, and I think Linux is the greatest thing since peanut butter. I haven't worked on OS/2 since release 1.1, which was quite incomplete (not to mention buggy as hell) but it featured a very nice API. I find the MS-Windows family of APIs to be ugly, quirky, inconsistent, and the most difficult of the three with which to become proficient. Fortunately, as middleware products become more mature and affordable hardware becomes more powerful, these issues are becoming more and more academic.

As a user, there's no doubt that the MS-Windows environment offers the widest selection of application software today, and will probably continue to do so for the foreseeable future. IMHO its level of application integration and interoperation runs rings around the other two environments.

Which is the "best" operating system? Beats me. Which is the superior color: crimson, magenta, or chartreuse?

> Let's put an end to this OS bashing now.

Watch it, Rick; suggestions like this could get you thrown off Usenet. ;-)

That's great! I haven't had any luck down here at EM10 (Austin, TX).
But it's been fun and interesting trying.

Actually, Rick, you are essentially correct. My response was
tit-for-tat, I am tired of mindless OS/2 advocacy. Whatever the
merits of OS/2 (they DO exist), it is NOT a replacement for Windows
95. Please don't think that I reject OS/2 unequivocally, I do not.

What are you trying to do here, Rick? Inject an element of rationality into
this debate? Just who the heck do you think you are?!

> I have Windows, OS/2, and Linux, on the same machine.

As a developer, I have a clear preference for UNIX, and I think Linux is
the greatest thing since peanut butter. I haven't worked on OS/2 since
release 1.1, which was quite incomplete (not to mention buggy as hell) but
it featured a very nice API. I find the MS-Windows family of APIs to be
ugly, quirky, inconsistent, and the most difficult of the three with which
to become proficient. Fortunately, as middleware products become more
mature and affordable hardware becomes more powerful, these issues are
becoming more and more academic.

As a user, there's no doubt that the MS-Windows environment offers the
widest selection of application software today, and will probably continue
to do so for the foreseeable future. IMHO its level of application

integration and interoperation runs rings around the other two environments.

Which is the "best" operating system? Beats me. Which is the superior
color: crimson, magenta, or chartreuse?

> Let's put an end to this OS bashing now.

Watch it, Rick; suggestions like this could get you thrown off Usenet. ;-)

>Further, you don't get anything more than OS/2 delivers.

The office where I worked ran NT on a P90 with 32Meg. Later we bumped it to 64 Meg. The conclusion was, that NT Server is a pig. It is bloated as heck and doesn't perform. I am assuming that what we really needed was a two or three processor machine. NT Server is not very useful on anything less than 64 Meg, and at least 2 processors of the P90 type.

I figured the NT client would be better, but it is a dog too.

So I figured I'd run it at home to analyze what exactly was sucking all the CPU down. It has a really nice performance monitor (and I love the tape backup stuff) so I studied it. It was running pretty good until I moved the mouse. Then the %system time went off the scale. OK, don't use the mouse. That left only one other problem, and that is the bloat. The programs need very high speed drives, as the files are pretty big. There's just too much overhead and the thing is sluggish. I take it back, maybe one CPU for the console, one CPU for the disk manager, and one CPU for the applications.

Anybody know a good 2 processor board that will plug in to a PCI bus?

Meanwhile my Caldera Linux screams in 8 Meg. One of the programs I found recently (there's just a ton out there) is the Samba program. I installed that, and now I can attach a network drive in WFW31 and WIN95 and get my Linux drive. Instead of Netbios, it uses TCP/IP (WFW TCP/IP is available on ftp.microsoft.com). This is really neat, as I thought maybe I'd have to purchase one of the PC-NFS or other NFS type products.

So yes, my vote is a linux X window machine, with a bunch of old WFW or WIN95 clients running Ham/Home/Network poop :-)

You don't have to convince me :-) : I know your country very well, and use
RMNC or PC/FlexNet every day. I perfectly know how it works, and how
efficient it is.

> If I want to connect a new radio, I just plug in a new card and that's
> it. The biggest RMNC I know has 15 cards, and it still performs good.

Have you read the article about DB0ZDF in the July issue of CQ DL ? It's
realy a nice and big system !

> See the RMNC/FlexNET as a good working box where you can connect all
> kinds of modems, terminals.. It's something you want to work if you
> need it. My RMNC is now running for over 4 years without any problems,
> lockups, resets. Can't even say this about my KISS tnc's.

Same thing here : we only need to update the master-Eprom when new versions
come out, and nothing else ! It is reliable, small, et efficient.

By the way, what's your local digi ? Maybe we could have a live chat one day.

: > having the source?

: o Fix bugs; sure, the author's track record to date may be very
: good, but what happens in the future if more pressing issues
: take priority?

I think it`s very unlikely that someone finds a bug in a piece of software
he`s not familiar with, faster than the author of the software can do.
Do you think this will change in future?

: o Add enhancements; compare the fuctionality of KA9Q's original
: NOS to the various derivatives currently available.

Well, compare the stability, too. KA9Q is said to be pretty stable (am I
wrong here?), and then look at some of the derivates.

: o Improve performance; there are a lot of folks out there with
: a lot of experience in link- and network-layer protocols who
: might have some good ideas to contribute.

Then contribute! But why do you have to hack the source for that? You will
find it a hard task to discover the design issues by reading the source..
Look, I just took the task to port Fred Baumgartens PingPong-Convers
package to PC/FlexNet. The first attempts were _very_ unstable, just
because some of my changes and enhancements conflicted with Fred`s code.

:
: o Education; somebody might actually *learn* something by being
: able to see how the application works.

Very doubtful. Looking at "alien" sources is somehow a masochistic habit.
Look, most software is not written for educational means, so what will
you learn from reading the source? How to write in C? Certainly you will
learn how the author uses to write in C :-) I think that is not worth
to spend time upon.

:
: o Port to new environments; I run Linux -- can I get binaries?

Why not. I run Linux, too. I don`t have the source for most of the binaries,
they simply work.

: One more point (just to fan the the flames, he said with an impish grin):
: although I am thoroughly unfamiliar with FlexNet, I would hazard to say that

: if one node running poorly modified code can bring the whole network to its
: knees, then the protocol it employs leaves a great deal to be desired. Who
: knows, maybe one of those folks interested in obtaining the source code might
: have some good ideas about how to make it a bit more robust.

I don`t want to bring up the old "BayCom vs FlexNet" discussion here again
(and hopefully noone else will!). One advise: take some literature, and read
about router design issues, and you will learn that any FlexNet-style router
is a very peculiar thing.

From: Robert Novak <robertn@sgi.com>
Message-ID: <413gq2$jfq@gazette.engr.sgi.com>
Source record: 41867

I am just learning about packet and have a few questions.

Is there a HF internet/packet gateway in operation? I would like to communicate with my partents via packet radio. They are ham operators and are in Mexico. They have a TNC(AEA Pakrat 232) and a PC that they currenty use for downloading weather info.

It is my goal to be able to send and recieve e-mail to/from them while they sail in Mexico and Costa Rica.

What is the best way to do this? Do I need to sign up with a service? What software do I need to send them?

Thanks in advance

While NT is certainly more stable than Win95, it's still a pig. 16 Meg
is the minimum memory to do any useful work, 32 Meg is a more realistic
minimum. The OS and its ancillaries are bloated things that thrash a lot
even on a Pentium 90 system with gobs of memory. It is, however, a real
operating system, unlike the GUI over DOS of Windows.

Both OS/2 and Linux require fewer resources to give good performance.
OS/2 is a better Windows for your Windows apps than Windows itself,
and it handles plain DOS apps better too. 8 Megs will give a comfortable
system, and a 66 MHz 486 is plenty for snappy performance.

While Wine for Linux is still alpha code and won't run many of your
Windows apps, Dosemu will run your DOS apps fine, and all the universe
of Unix apps is open to you. Linux will run nicely in 4 Meg, though
if you want X, bumping that to 8 Meg is better. Linux will run productively
even on a little SX 20 MHz laptop with a small hard disk. OS/2 requires a
bit heavier duty laptop to run productively, but NT is a disaster on all
but the very top super-laptop machines (and who can afford those?).

It seems to me that we're going backwards in some ways. Back when
a 4 MHz Z80 was the hot setup, Wordstar would work comfortably in
48 kb of memory, and edit huge files practically as fast as the disk
could run. Today, pigs like Microsoft Word need gobs of memory and
a fast processor, and they're still glacially slow. Most people seem
to say "So what? We've got fast hardware now." That's true, but tightly
coded applications still let you do more, and do it faster. And it
certainly seems absurd when a 100 Mbyte hard disk won't hold the
applications you used to be able to carry in a box of floppies.

Linux, and Unix in general, were designed with the idea of efficient
coding and use in mind. Most of its apps are designed to do only one
thing, but to do it very efficiently and well. The OS then lets you
chain apps together in many ways to achieve high productivity. You'll
rarely find an app as bloated as MS Word on a Unix system. And the OS
is written the same way, fast and lean. This allows you to utilize
your hardware to its fullest extent. Even a Unix can become bloated,
Solaris is an example, but it doesn't have to be that way. A fully
functional Linux can fit on 8 floppies, with enough apps to do real

work, though having a 20 Mb hard disk makes it more convienent. Try running NT on such a system.

To bring this back toward digital radio a bit, what kind of machine do you want to tie to the radio (and indirectly to its lightning enticing antenna)? Its unlikely it would be one that can run NT. However, one running Linux would be ideal. Either fixed or portable, you can run affordable hardware (and *free* software) while having the full networking functionality of Unix, something that's a kludge at best under the other OSs, even if you're willing to risk your heavy hardware to run them.

Sure, you could run NOS on a cheapy DOS box, but that's *all* it could do. Running Linux allows you to run apps *while* networking, either independently, or as apps *over* the network. In some ways, Windows is a nice standard GUI, but it isn't very good over a network. If you need a GUI over a network, X is *much* better. Its client-server design is optimized to minimize demands on the network channel.

I have a Smartmodem 1200, and am considering something related. The
problem is that the 1200bps packet is Bell 202, and the 1200bps on the
telephones are 212A. They are not compatible. I don't know if it's
possible to modify the modem so that it does 202. There's also a block
diagram on A-14 of the manual (the old orange one) on how to hook it up to
a radio. Good(?) news is that the 300bps mode is 202 for both packet and
phone. BUT...

It should work just fine, as long as you communicate with other phone
modems (unless you're able to modify the modem).

Good luck.

>and/or MS-DOS executables.

I just talked about this with Gunter (DK7WJ) about this.
The main problem was the lack of a complete English documentation.

He's now busy building a new release of PC/FlexNet with some minor fixes
and English docs.

I'll inform you here how to get it if it's ready for distribution.

3737. Help with PK232MBX purchase..

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-08-19 00:00:00 UTC
From: desaid@muvms6.wvnet.edu
Message-ID: <1995Aug19.213123.7566@muvms6>
Source record: 41874

Hello All:

Today I bought pk232MBX from local Ham and version is 7.0
dated Dec 1, 1993. I was told it has pactor and Gateway installed
I have not tested it for those modes. I would like to know what
is the latest version and are there any advantages with new version
if it exists. I mean EPROM version. It came with pakratt software
for windows. Please advise me on whether it is good buy or not.
I paid $180 for this unit. I have option of returning the unit.

Please let me what the experienced people think.

Thanks for your help.

Pietro,

Im not sure what you mean exactly by the 43 mhz, but here in Lafayette, we have set up a LAN on 446.900 using 9600b tcp/ip. Our LAN includes a gateway, that I have successfully installed and configured trumpet to access the Net via packet radio. Our gateway is running Jnos, and merely passes the tcp/ip traffic. From there, I've configured Trumpet 2.0b to use ethrax25.zip and winpkt.com as the packet drivers, and have obtained web pages from Netscape, mail from Eudora, and even IRC from WS_IRC. Also included are the general apps such as finger and telnet. All seem to work fine, albeit slow at 9600b, but they are at least a way for Hams in the Lafayette area to get their feet wet before shelling out money for a telephone connection to the Net.

Hello,
I need some info about packet radio socket software:
Can one of the follows radio modems operrate with 'Trumpet Winsock'
socket software at 9600 baud, carrier at 43 Mhz (ch 40 Khz)?
AEA PK96, TINY 2MK2, BAYMOD9600, SPIRIT 2.
If not, exists some shareware/freeware socket software to start a
TCP/IP link and to run software as Netscape, etc?
Is it possible to setup 'Trumpet Winsock' or other socket software to
work with a 'fast-simplex' modem which works at 9600 baud, 43 Mhz (ERE
RMO.94, made in Italy)?
Thanks in advance,
Pietro Carratu'

You're wrong ! DG0JAB has translated the whole FlexNet German manual into English (I have a beta release on my HD), and I've translated my French PC/FlexNet + FAQs into English (corrected in Great Britan, hello Ian !).

In addition, most of the drivers now have a multilanguage DOC file : English, French, and German.

So everything is about to be ready for an international release :-))
Let's wait until DK7WJ officially releases the version.

[snip]

The problem is the delay times in radio. Instead of milliseconds, the best you can do is seconds. Most network software is designed for milliseconds and this timing is just too fast for radio.

Solution:

Build a router. Get the k5jb net program from:
ftp.ucsd.edu:/hamradio/packet/tcpip/k5jb or incoming

and an old junk XT or AT (floppy only is good). The reason is, is you don't really want all that bullshit layered into the xxxNOS series. NOS makes a poor BBS, it makes a poor everything. The creeping featurism has made it into a fat pig that requires a dedication unworthy of its use as a router.

Joe Buswell (k5jb) has spent his time on the old NET program debugging it and not stuffing it. It makes an excellent router. So here's my recommendation:

XT with floppy
K5JB NET
Packet MODEM and RADIO
Ethernet Card (NE-2000) Cheap

Then hook this into your network and you're done. The packet router then handles the AX.25 protocol and seconds timing, and it also handles the Ethernet timing to your WIN95, WFW, OS/2, Linux, Unix, you name it.

3743. FT-290R

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-08-20 00:00:00 UTC
From: clint.bradford@woodybbs.com
Message-ID: <93.1447.7582.0NFBAE41@woodybbs.com>
Source record: 41880

Subject: FT-290R

>>...Packet Radio...Yaesu FT-290R...

Here's a note I found on ATTENTION to Details BBS (909) 681-6221 in
their extensive MODS database:

There is a very "hard" de-emphasis in FT-290R. This can cause serious
problems copying packet signals with some demodulator chips, eg. like the
XR2211.

By a common request, here is a modification of this popular TCVR for packet
radio. It was made after a RADIO-REF article in several copies, by HA5OB,
HA5DI, HA3MA and others. Increasing the intelligibility in noisy environment,
this modification is also useful in FM voice communications.

You'll have to add only a serial RC unit, the R being 4.7 kOhm, and C being a
1uF tantalum capacitor. Put them between the pin 9 of IC Q1019 and the
collector of transistor Q1021, with the positive leg of the tantalum
capacitor to the collector of the transistor. These points can be found as
test points, near to IC Q1019. Solder the components together, wrap some
insulation around them, then solder to the test points mentioned. That's all
you have to do!

With this modification, FM reception will sound somewhat noisy, but much
louder.

3745. IP Network Links at 5.7 Mbps

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-08-20 00:00:00 UTC
From: ssampson@icon.net
Message-ID: <ssampson.217.000BDA9C@icon.net>
Source record: 41882

Tinker AFB here in Oklahoma has solved one of its network problems
by using the Cabletron AirPort II product. The link starts on a roof
about 15 ft off the ground. It then is aimed at a telephone pole on
a slight hill. Here they have three other AirPort products. One to
the first link, and two more for the other two end points. So the
telephone pole and RF heads act like a router to the three seperate
networks (ties them together).

To top it off, the AirPort series uses the Ham bands with Part 95 rules.
The reason Hams would never have designed this, is because we are limited
to AX.25 and a 17 bit shift register for spread spectrum. You could use
other protocols than AX.25, but you can't then transport third party data.
Well actually someone could have designed it in the hopes that the AX.25
would finally die, and real SS chips from the industry would be allowed.
This is a far fetched hope; however, as the ARRL is in no mood to advance
digital protocols past anything the Choo-Choo used in 1870 (didadidadidah)

Specifications:

AirPort Series Wireless Interbuilding Ethernet Systems

Hubs

Chassis:

AirPort I:
6" H x 17" W x 17" D (43 cm D x 43 cm W x 15cm H)
Desktop or rack mount (Standard 19" rack adapter supplied)

AirPort II:
9" H x 18" W x 16" D
Desktop or rack mount

Antenna:

AirPort I:
27 cm D x 19 cm W x 47 cm H (18.5" H x 7.5" Wx 10.5" D)
Desktop, wall or ceiling

AirPort II:
Outdoor roof mounted 24" dish Indoor window mounted 16" square planar

Remotes

Remote with Antenna:

AirPort I: 10cm D x 18 cm W x 28 cm H (11" H x 7" W x 4"D)
Desktop or rack mount

AirPORT II: 43cm D x 43 cm W x 15 cm H (17" x 17" x 6")
(Desktop or rack mount, standard 19" rack adapter supplied)

Interface Unit:
18cm D x 13 cm W x 6.5 cm H (7" x 5" x 2.5")

LAN Interfaces

Hubs:
IEEE 802.3-compliant 10Base-T (RJ45 uncrossed), AUI (female)

Remotes:
IEEE 802.3-compliant 10Base-T (RJ45 crossed), AUI (male)

Performance

Radio Signaling Rate:
16 Mbps aggregate (2 independent 8 Mbps channels)

User Data Throughput:
5.7 Mbps aggregate

RF Specifications

Frequency Bands:

Hubs:
Transmitter: 5.746-5.830 GHz 84 MHz Bandwidth (42+42)
Receiver: 2.400-2.484 GHz 84 MHz Bandwidth

Remotes:
Transmitter: 2.400-2.484 GHz
Receiver: 5.746-5.830 GHz

Modulation Technique:
Direct Sequence Spread Spectrum

Encoding:
16 PSK with Trellis encoding and FEC

Spreading Factor:
32 chips per baud

Effective Radiated Power:
1 watt

Effective Range:
AirPort I: 300 meters (1000 feet)
AirPort II: 1.4 km (4750 feet)

Electrical Specifications:
Hubs: 90VAC-250VAC, 50-60 Hz, 250 watts

Remotes: 90VAC-250VAC, 50-60 Hz, 22 watts

Antenna Characteristics:
AirPort I: 120° horizontal coverage, 60°

vertical coverage

AirPort II: 7° beamwidth vertical polarization

Hell this isn't anything a Ham couldn't do given the incentive, and we could economically use 10 Watts instead of 1 Watt.

AirPort I Wireless Solution

AirPort I is an interbuilding connectivity solution primarily designed for smaller distances. AirPort I can communicate at distances up to 300 meters (1000 feet) with general line of sight to the point of connection. Utilizing a wireless hub/remote architecture, the AirPort I relies on a standalone hub to manage the product's remote device. This ensures optimal performance and a reliable data channel in the face of unpredictable atmospheric conditions.

AirPort II Wireless Solution

AirPort II provides an interbuilding connectivity solution with the flexibility to be installed indoors or outdoors. It can communicate at distances up to 1.4 kilometers (4750 feet) with general line of sight to the point of connection. Remote-Hub-Remote access is 2.8 kilometers. Similar to the AirPort I, the AirPort II features a wireless hub/remote architecture providing reliability and low error rates in inherently difficult communication environments.

Benefits of Cabletron's Wireless Solutions
Spread Spectrum Technology for Transmission Security

Spread spectrum radio transmission techniques used in the AirPort Series are extremely difficult to intercept and much more immune to Radio Frequency (RF) noise than conventional radio. This type of radio system has been used extensively by the U.S. military because of its inherent security characteristics. Security is further assured through a pre-set ID code that the hub uses to communicate with the wireless remote.

No FCC Licensing Required

The AirPort Series operates on a bandwidth which requires no end-user licensing. This allows for a wide variety of installation possibilities since users do not have to obtain FCC licensing every time they move their wireless equipment from one area to another.

SNMP Manageable

Users are provided with performance information, operational control and diagnostics of the AirPort Series from any SNMP-compliant management systems, including Cabletron's own SPECTRUM® for Open Systems(TM).

Connects Easily to Existing Wired Networks

Cabletron's AirPort Series is fully compatible with all existing IEEE 802.3 specifications. It works with any Ethernet device and is fully compatible with all existing network protocols and operating systems. Essentially the AirPort Series operates similarly to a wired system except that, as a standards-based network, it can be set up anywhere, at any time, with minimum tools, expertise or disruption to ongoing activities.

There you go, real packet radio at speeds that cause G related illnesses. Put a 1.2 kbps AX.25 link on the same path and see which one can transfer the most poop. I think I know which one will win.

The above Cabletron information was taken from their WWW server on the internet. Do a lookup on Cabletron to find them.

Come on Steve! You know better than this! You are leaving facts out of your story that are clouding the issue.

1) The AX.25 requirement was dropped from the Part 97 rules a year ago. There is no more requirement for AX.25.

2) The 17-bit shift register limit is in the present rules but there is an STA that allows experimentation of _any_ spreading code. It is easy to join. (I sent you this information several months ago). Details are available on the web site listed below.

3) What are you doing to encourage the FCC to have the rules changed?

But you did not tell everyone how much this system costs. I am sure that a group of hams can banter up the money and establish a backbone, but the user costs are still too high for Joe Average Ham. Yet there are hams that have done this very thing. To read about it goto http://www.sp.nps.navy.mil/ss/other.html.

>---
>
>The above Cabletron information was taken from their WWW server on the

Why not tell people what the URL is?

Goto http://www.ctron.com/Catalog/Standalone/AirPort.html

I established an Amateur Spread Spectrum web site in May to inform Amateurs about Spread Spectrum communications. It lists all the rules and regulations pertaining to SS in Part 97 and 15. There is a biblography of text books and journals one can read to learn more about SS and an entire web page with pointers to other SS related pages on the Web. The URL is:

http://www.sp.nps.navy.mil/ss

I am always looking for new information to put on the web site and links to connect to.

I also wrote an introductory article about Amateur SS in the June QEX (under NK6K's Digital Communications Column). It tells of experimentation hams can do to advance the art of radio (SS radio that is).

1995 ARRL Digital Communications Conference
September 8-10th, 1995
Arlington, Texas (minutes from DFW airport)

Full text is available on the Internet:
FTP: ftp.tapr.org WWW: http://www.tapr.org/tapr E-Mail: tapr@tapr.org
---

Preregistration ends (Monday) August 21st! Register early and save money. Registration for the conference will continue up to and through the conference.

The Table of Contents for the Proceedings is attached below. Many of the papers will be presented along with breakout sessions and workshops. The conference is shaping up nicely.

The 1995 Digital Communications Conference will be held on September 8-10th, 1995 in Arlington, Texas. Arlington is just minutes away from the Dallas/Ft. Worth International Airport.

Tentative Schedule Overview (as of 8/20). A full detailed schedule will be sent after confirmation from speakers are received.

Friday, September 8th, 1995
3:00pm - 6:00pm Registration
4:00pm - 7:00pm APRS Workshop, Keith Sproul, WU2Z

Saturday, September 9th, 1995
8:00am - 5:00pm DCC Registration

Session 1a - 8:30am - 10:10am (110 mins)
Paper Session #1

Session 1b - 8:45am - 10:15am (115 mins)
Beginning/Intermediate Session #1

Session 2a - 10:30am - 12noon (90 mins)
Paper Session #2

Session 2b - 10:30am - 12noon (90 mins)
Beginning/Intermediate Session #2

Lunch - 12noon - 1:30pm

Session 3 - 1:30pm - 3:30pm (120 min)
Paper Session #3

Session 4 - 4:00pm - 5:00pm
Breakout Session

Dinner - 6:00pm - 8:00pm
Banquet Speaker (TBA)

Informal Meeting Area - 8:00pm

Sunday, September 10th, 1995
9:00am - 1:00pm PCS Workshop, Dewayne Hendricks, WA8DZP

The beginning/intermediate sessions will cover the following topics during the two Saturday morning sessions: Introduction to Digital Communications, Introduction to HF Digital Communications, Introduction to Packet Networking, Introduction to APRS, Introduction to TCP/IP, and Introduction to Satellite Communications. The three paper sessions will present information from the proceedings.

The ARRL Digital Communications Conference is an international forum for radio amateurs in digital communications, networking, and related technologies to meet, publish their work, and present new ideas and techniques for discussion. Presenters and attendees will have the opportunity to exchange ideas and learn about recent hardware and software advances, theories, experimental results, and practical applications. The Digital Communications Conference is not just for the digital elite, but for digitally-orientated amateurs of all levels of experience.

Not only is the Digital Communications Conference technically stimulating, it is a weekend of fun for all who have more than a casual interest in any of the ham digital communications modes. This includes BBS operators, networkers, DX-Cluster Sysops, software writers, modem designers, and digital satellite communications enthusiasts. The Digital Communications Conference is for all levels of digital operators -- a must conference to attend to get active on a national level.

In addition to the presentation of papers on Saturday, two workshops will be held during the conference. On Friday, Keith Sproul, WU2Z, will hold a workshop on APRS packet-location software. Keith is the Chair of the TAPR APRS Special Interest Group, developer of the Macintosh version of APRS, and a leader in the area of APRS technology. This is a unique opportunity to gain insight into this fast growing new digital aspect of amateur operations that combines computers, packet radio, and GPS (Global Positioning Satellites). On Sunday, Dewayne Hendricks, WD8DZP, will conduct a workshop focusing on a survey of Personal Communications Systems and their applications and use in the Amateur Radio Service. Dewayne is an expert in the area of commercial wireless systems; his company WarpSpeed Imagineering, focuses on wireless Internet. This workshop presents an opportunity to learn how Personal Communications Technology (handheld and small business wireless systems) can be used in the amateur service.

There are few activities where the importance of your participation can be so much fun and important! What a great way to share and renew your enthusiasm for digital amateur radio! Getting together with colleagues from all over the world and bringing each other up to date on your latest work. All this, and more, for an unforgettable weekend of ham radio and digital communications. Make your travel and lodging arrangements now. We hope to

see you at the ARRL Digital Communications Conference on September 8-10!

Full information on the conference and hotel information can be obtained by contacting Tucson Amateur Packet Radio, 8987-309 E. Tanque Verde Road, Tucson, AZ 85749-9399. Phone: (817) 383-0000. Fax: (817) 566-2544. Internet: TAPR@TAPR.ORG

Sincerely,
Greg Jones, WD5IVD - President, Tucson Amateur Packet Radio
Dave Wolf, WO5H - President, Texas Packet Radio Society

Hotel Information

Conference presentations, meetings, and workshops, will be held at the La Quinta Inn and Conference Center, 825 N Watson Road, Arlington, Tx, (800) 531-5900, (817) 640-4142, Fax (817) 649-7864, intersection of I-30 and Texas 360. Rooms rates are $53/single, $58/double, $63/triple, and $85+ for suites. When making reservations with the hotel, be sure to indicate you are attending the conference. Six Flags (larger than Disney Land), the Texas Rangers, and several other attractions are within a few miles of the hotel. The hotel provides transportation to and from D/FW International Airport. You should contact the hotel to arrange airport transportation.

Registration

Contact the TAPR office by Phone (817) 383-0000, Fax (817) 566-2544, e-mail (Internet: tapr@tapr.org) or www.tapr.org to pre-register or for additional meeting information. MasterCard and VISA accepted.

3751. Re(2): FlexNet for digipeaters

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-08-20 00:00:00 UTC
From: gjones@teachnet.edb.utexas.edu
Message-ID: <279294.ensmtp@teachnet.edb.utexas.edu>
Source record: 41888

Gunther Jost, DK7WJ, will be attending the ARRL Digital Communications Conference in Arlington, Texas, Sept 8-10th. See the message I just posted for more details on the conference. Lots of room left and DFW airport is easy to fly in to.

Gunther will be presenting a paper entitled 'An Introduction to FlexNet'. This would be an excellent time to contact Gunther and find out what FlexNet is doing.

If you haven't attended a DCC in the past, it is one of the digital conference of the year to make. Many of the best developers and technical people in digital communications attend each year.

Cheers - Greg, WD5IVD

HELP

3754. Cell Phones & RFI affecting computer systems?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-08-21 00:00:00 UTC
From: rlm@columbia.ds.adp.com
Message-ID: <41a84t$2o9@maureen.teleport.com>
Source record: 41744
Cross-posted to: alt.cellular-phone-tech,rec.radio.amateur.digital.misc,alt.radio.digital,rec.radio.amateur.antenna

Hi,
Does anyone have information on Cell Phone RFI, and how it might affect large computer systems utilizing VLSI and high density SMT designs? There was an article in a local paper several months ago talking about how cell phones were causing problems to systems in hospitals, like heart machines, ect. The article said something about possible federal laws prohibiting cell phone use in hospitals. I've also heard that they are discuraged on airplanes as well.

The reason for the inquiry is that we have a client with a large computer system that seams to reset several times a day for no appearant reason. The physical site has been throughly evaluated, the system swaped 3 times, the UPS was swapped, the power has been rerouted, and the problem persists. The systems that were returned work fine, no problems. There is a Cell Phone repeater tower within visual range of the client site, and I'm wondering (grasping at straws really) if there could be some form of RFI causing the CPU to reset.

Anyone with constructive info please email me at rlm@columbia.ds.adp.com

Thanks.

3755. Re: Will SP v6.0 + PK-88 work?

There are 2 ways. Use KISS mode or exchange the EPROM with an
TheFirmware version wich runs on the PK88. TFPK27 is the latest.

>has a clean (i.e., still in the original ZIP file w/ installation
>program) version of the program. SP looks interesting, and according
I must have version 6.50, wich is the last freeware version, on my BBS
The program is now at version 9.52 but you have to buy it (DFl 139,-)
But you can get a limited demo version.

>to work. Even though I RTFM thoroughly, and modified the CONFIG.SP
>file, the program keeps loading up with the previous user's (whom I

It looks like you have more CONFIG.SP files, propably in a subdir.
Setting the SPDIR variable to your SP dir might also help.
Normaly it will be: SET SPDIR=C:\SP\CFG

> KISS ON
The PK88 wil instantly switch to KISS mode after this command, so

> HOST ON
does not work, issue this command before KISS ON.
BUT, you must NOT use this command, it sets the PK88 to AEA hostmode.
Not WA8DED/TF hostmode required by SP.

>garbage on the screen before I enter the "host on" command. Is this
The garbage is propably just packet data ;-)

And if you use TFPCX, set the PORT= in CONFIG.SP to 5

What are the changes to JVFAX from 7.0 to 8.0?

Greg KO6TH

p.s. yes, it transmits, but they didn't include the schematic for the interface in the documentation... I had someone send it to me, via JVFAX, of course!

(for the curious, it consists of a 20uf non-polar cap, series resistor (volume control), and a 1k - 8 ohm audio transformer. RS-232 pin 2 (TxD) to cap, transformer secondary to tranceiver mic input.)

3758. Data Repeater info needed

Hi all.
I am interested in putting up a full duplex data repeater in our area and unfortunately must confess that I know almost nothing about data repeaters. Specifically those using bit regeneration. I realize that just connecting a full duplex tnc to the thing isn't sufficient.
Anyone out there care to comment? I should add that I am familiar with normal packet operation as well as voice repeater theory. It is just the data part that has me stumped! hi

Thanks and 73 -Rob-

Look at (ftp)grivel.une.edu.au and there you will find s/w for a BAYCOM modem, There are 3 packages that I have had success with, Baycom,TPK & Graphic packet. Now you will need a modem. I built up a Baycom modem earlier this year and it works great. With the Baycom modem the pc does most of the work and for a grand outlay of about $50 you can get goning on packet.Incidently, Tom Moffat had an article in Electronics Australia several years ago describing a thing called the "pocket packet". This is no more than the original Baycom Modem. I think the circuit is also at that ftp site in postscript format. The only slightly difficult thing will be obtaining the TCM-3105 modem chip. I got mine through mail order from Geoff Wood Electronics in Sydney for about $14. I think the Moorabbin Radio club here in Melbourne will sell the entire kit with pcb and all bits for about $50. The type of radio seems to be no problem. Baycom will run on a 4.77 M xt whereas GP/TPK requires an XT with a clock speed 8 Mhz. I hope this information helps you get going on AX-25 packet.

3762. New Ham Test Simulators - Macintosh

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-08-21 00:00:00 UTC
From: john@wd1v.mv.com
Message-ID: <john-2108950524590001@wd1v.mv.com>
Source record: 41889

The new Macintosh Ham Test Simulators are HERE!

Novice Ham Test 5.0 SA.sea
Technician Ham Test 5.0 SA.sea
General Ham Test 5.0 SA.sea
Advanced Ham Test 5.0 SA.sea
Extra Ham Test 5.0 SA.sea

The latest versions feature:

HyperCard 2.3 as a stand-alone application (SA) eliminating
the need to have HyperCard. All you need is a Mac with 4
Meg of memory and version System 7 or greater.

Each version 5 Ham Test Simulator has the latest questions
as prepared by the Question Pool Committee.

Each Ham Test Simulator is FREE OF CHARGE and work the
same way as the originals written by Diana, KC1SP.

You may obtain a Ham Test Simulator by mailing me a *FORMATTED
disk (1 per test) and include a Self Addressed and Stamped disk
mailer for the return.

Each Ham Test Simulator is also bundled with a shareware CW
program called MacMorse 1.4 written by Doug, WB0EON.

Also included are a collection of text files that relate an
interesting variety of ideas about the best way to study CW and
prepare for tests.

or warm your phone line and get just the tests:

America On Line - Macintosh Ham Radio Section

ftp://oak.oakland.edu//pub3/hamradio/mac/theory-and-morse/AdvancedHamTest1.sea.bin
ftp://oak.oakland.edu//pub3/hamradio/mac/theory-and-morse/ExtraHamTest.sea.bin
ftp://oak.oakland.edu//pub3/hamradio/mac/theory-and-morse/GeneralHamTest.sea.bin
ftp://oak.oakland.edu//pub3/hamradio/mac/theory-and-morse/NoviceHamTest.sea.bin
ftp://oak.oakland.edu//pub3/hamradio/mac/theory-and-morse/TechnicianHamTest.sea.bin

Your comments and suggestions for future versions are always
welcome. Stay in touch and good luck with your next test!

3764. Will SP v6.0 + PK-88 work?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-08-21 00:00:00 UTC
From: afn01115@afn.org
Message-ID: <419t0e$g2e@huron.eel.ufl.edu>
Source record: 41891

Has anyone who has an AEA PK-88 and is running SP v6.0 (or at least v6.x), please tell me how they did it? I'm also interested if anyone has a clean (i.e., still in the original ZIP file w/ installation program) version of the program. SP looks interesting, and according to the copy of the docs I got from another ham, it theoretically should work if I use the TFPCR driver. Unfortunately, I can't get it to work. Even though I RTFM thoroughly, and modified the CONFIG.SP file, the program keeps loading up with the previous user's (whom I got the program from) callsign, a completely different frequency, and insists on saving the incoming data from each file. All this despite the settings to the contrary in CONFIG.SP.

As for the TNC part, I have been told that I need to set the PK-88 in KISS mode. According to the manual, the following commands put it in KISS mode:

```
CONMODE TRANS
PPERSIST ON
RAW ON
HPOLL OFF
KISS ON
HOST ON
```

Unfortunately, after I do the "kiss on" command, the TNC throws garbage on the screen before I enter the "host on" command. Is this the correct way to do it?

After five hours of struggling with SP and my PK-88, I appreciate any help that is offered. Tnx.

Steve KC6WCH

--
(EL89tq) 29N 41' 26" / 82W 21' 17" | "I have never really understood the
KC6WCH @ N0ARY.#NOCAL.CA.USA.NA | rationale behind sports...which
http://www.freenet.ufl.edu/~afn01115 | all seem like exhausting new ways of
http://www.freenet.ufl.edu/~gars | getting injured while sweating." -LGW

Rights sound so righteous. But the new rights aren't rights at all: They are blunt powers masquerading under the name of rights. The rights our forefathers died for are a shield -- government can't tell me what to do or say -- to preserve our freedom from others ordering us around. The new rights are a sword. They are hailed under the flag of freedom. The coinage of the new rights of the new regime has a flip side; it is called coersion.

>Jay J. Chichon
>w2ltu@pipeline.com

Yep, I had the problem also. As I remember, it has to do with the signal driving the audio mute circuit being pretty slow. I vaugely remember removing a rather large cap (1 uf or so , OK not so large) in the squelch circuit that feeds the mute circuit. Drastically improved turn-around time; pactor now works OK. I also have done extensive AGC mods...someday I'll post em'. I have just about the smoothest 940' I have ever heard. E-mail me to remind me to find the pactor fix if you come up empty and still need help.

940's....no two perform quite the same....

Hi

I just downloaded Mac APRS. I have a mac, tnc and 144, 220 and 440
radios. I'd really like some help getting setup. The documentation left
me confused and the program isn't clear as to what's implemented and
what's not. Ideally, I'd like someone in the SoCal area who could spare
some time. As a minimum, I'd like a frequency where there is soem APRS
traffic that I can listen in on.

Thanks,

Marc

Indeed, the Gracilis PacketTen is designed to drive 3 T1 channels
simultaneously. Expensive, of course.

Some time ago (few years now) I did some work with RTTY demodulation, back then there were various news agencies Kyodo etc that transmitted news stories in plain english text.

I tried the same thing recently and couldn't get anything... so my questions are:-

1) Do the use FEC or some other means of error correction so the signals are no longer pure RTTY.

2) Are these signals encrypted?

3) Is there an RTTY station frequency list somewhere on the net, if so where can I ftp it from?

In response to some of my earlier comments, Matthias DG8Y writes:

> > Fix bugs....
>
> I think it`s very unlikely that someone finds a bug in a piece of
> software he`s not familiar with, faster than the author of the
> software can do.

Agreed. But that wasn't my point. I meant to suggest that even if the author has a good track record to date, this particular piece of software may not be high on his priority list in the future. KA9Q cranked out improvements to NOS for several years, but unless I'm mistaken he hasn't touched it in years. That task has been left to his successors, who had access to his source code.

> > Add enhancements; compare the fuctionality of KA9Q's
> > original NOS to the various derivatives currently available.
>
> Well, compare the stability, too. KA9Q is said to be pretty stable
> (am I : wrong here?), and then look at some of the derivates.

I'm under the impression that there are a lot more folks running TNOS and JNOS these days than any of KA9Q's original versions. I'm also under the impression that the current versions of these derivatives are satisfactorily stable. I run a Jay Maynard's just-barely-modified version of KA9Q NOS on my HP100LX plamtop, but only because it's the only version I've gotten to run on it.

> Improve performance
>
> Then contribute! But why do you have to hack the source for that?
> You will find it a hard task to discover the design issues by
> reading the source.

Assuming there are no gross design flaws, most performance issues are, in my experience, implementation related. It's difficult to suggest improvements, however, without source code.

> Look, I just took the task to port Fred Baumgartens PingPong-Convers
> package to PC/FlexNet. The first attempts were _very_ unstable

Understandable, perhaps even predictable. And I'm sure that this situation will improve in subsequent releases. Still, I'd hazard to guess that the code you have now is more stable than if you had set out to write a your own "conversd" from scratch, so you (and the rest of the FlexNet community) have benefitted from having access to Fred's source code.

> > Education; somebody might actually *learn* something by
> > being able to see how the application works.
>
> Very doubtful. Looking at "alien" sources is somehow a masochistic
> habit. Look, most software is not written for educational means,
> so what will you learn from reading the source?

I have to disagree almost completely on this one. Even maginally competent beginners can write original code that works. The mark of a true software engineer is the ability to debug and maintain other people's code. In a professional environment it's absolutely essential.

> > Port to new environments; I run Linux -- can I get
> > binaries?
>
> Why not. I run Linux, too. I don`t have the source for most of the
> binaries, they simply work.

Again, I think you've missed my point. Forget Linux, for which I gather a port is underway. Let's say I run Plan 9. Where do I get FlexNet binaries?

I'm really not trying to pick a fight with Matthias -- or anyone else, for that matter! I'm merely trying to advocate open systems. I don't expect that I'm going to persuade Mattias to adopt my point of view, nor do I expect he'll convice me to adopt his. I do hope, however, that my arguments will stick in the minds of everyone else that reads this thread, and perhaps persuade them to share any code they might write with the community at large. Neither Matthias nor I is "right", nor is either of us "wrong". It's basically a matter of philosophy.

There was a time back in the old days at MIT, where the common practice was to leave your code (on paper tapes!) in drawer of the desk in the computer room. The next time you saw it, someone else had looked at what you'd done, added his own enhancements, and put it back in the drawer. Sure, you had to fix the new bugs that he'd introduced, but in the long run you wound up with a superior piece of code by virtue of many people's participation in its development. Before the media corrupted the term, this was known as "hacking". One little nerd from Harvard who like to bop over to MIT to polish his programming skills wrote a simple BASIC interpretter, but he refused to follow the unwritten rules and share it. Instead, he sold it to Altair, an early manufacturer of 8-bit micros. As other computer manufacturers started to pop up, he sold his code to them, too. Eventually he formed a company with which to continue his efforts, and he called the company "Microsoft". Yes (as if you hadn't already guessed), the little nerd's name was Bill Gates.

Like I said, closed systems aren't necessarily "wrong", but given the choice, I'll take open systems any day. That's why I finally installed Linux about six months ago, and I have seldom found the need to boot Windows since....

Hello,

I have the following things for sale:

1. MFJ-1278 Multi Mode Data Controller TNC
- Mint Condition
- Used for less than 5 hours!
- Includes all manuals and original packing.
- Includes a certificate to upgrade the ROM for free.

2. MULTICOM Communication package that works with MFJ 1278
- All manuals and disks (3.5') included.

3. Accessories
- TNC to Computer cable
- HT (Icom) to TNC cable
- Power supply

******* TOTAL PACKAGE FOR: $ 225.00. ********

Note:
You have to handle shipping. Total package weighs about 4/5 lbs.

If interested, please e-mail me at: rafeek@netcom.com

I don't think that the gunplexer link can do full duplex anyway. You are modulating the local osc to send the data so I expect that you'd see the data you sent coming back at you. The N6GN system would have to have circuitry added to cancel out the transmitted data on receive.

What I just said is true right? I've seen so many references to full duplex gunplexer links that I'm starting to worry that I might be out to lunch on this.

>Anyone out there care to comment? I should add that I am familiar with normal
>packet operation as well as voice repeater theory. It is just the data part
>that has me stumped! hi
>
TAPR has a 9600 baud modem with a bit-regen option. Using this modem there is
really nothing else you need as far as repeater control. The PTT, a timeout
timer, and the bit-regen is handled by the modem no other control is required.
Obviously all the 'normal' full duplex repeater stuff is still required.
(duplexers, isolators, hardline, GOOD antenna {one that does not change input
impedence in the wind:} transmitter, rec, etc..)

If you are planning on using 1200 baud (i can't imagine WHY anyone would want
to bother putting an large investment into a 1200 baud machine) it's a little
more difficult. I have not seen anyone offering a 1200 baud reclocking bit
regenerator. I did build a 'down and dirty' regen circuit for a tnc2 using a
couple of nandgates to wrap the data out of the 2211 chip to the tone gen and
run the PPT via the DCD output of the 2211, but it's sleazy. Any minor phase
distortion of the received signal is not corrected and simply gets repeated
out the transmitter. This ends up making the slight phase error caused by the
2211 detector appear additive at the destination station. Depending on TNC
calibration this could in theory cause the data to be corrupted to the point
of not being decodeable. In practice this is hasn't turned out to be all that
much of a problem and the 1200 baud machine i build seems to work pretty well.

If you really want to 'do it right' think about designing a way of reframing
the data. Using the data clock and a couple of flip-flops should allow you to
reclock and clean up the data. Obviously there will be lag of a couple of
clocks but this shouldn't be a big issue.

Source record: 41771

Hello, we're working on setting up a gateway down here, and we plan on using JNOS version 1.10i. I've been trying to use the 'tcp access permit', 'tcp access deny', 'ip access deny', etc, but NOS does not recogize them. Is there any way to set up these parameters? does version 1.10i just doesn't have these options or what???

Also, does anyone know if there is any mailing list for NOS users or for gateway sysops (i.e., gateway sysops who don't know what they're doing :-))

Anyway, thanks in advance for any help and 73.

OK, here's what worked with my 940 (s/n 8 mil). I can't garantee this will work because as you noted, there's quite a bit of variation in performance from unit to unit.

Remove c136 (33 uf, 16v) on the control unit. I pulled mine out with a pair of longnose pliers because getting at the bottom of this board to properly unsolder the component would have been a nightmare. Removal of this cap will alter the action of the squelch circuit but not to the point where it is no longer usable. I don't use the squelch too much so I didn't care. Next, find VR1 on the rf unit. Turn it all the way ..... hmmm, clockwise or counterclockwise. I don't remember. Turn it in the direction to its stop that produces maximum rx sensitivity. This will disable agc action to the rf front end. On many 940's I have seen, the time constant added to the agc voltage at the front end is excessive (in the order of 200 ms) which may be fine for normal operation (not that I think so; Kenwood really missed the boat on the design of the the agc in this rig.) but not for fast rx/tx turn around times.

I, of course, cannot be responsible for these or any other mods you make to your radio.....[standard disclamer stuff]

Good luck. Let me know how you make out.

3790. NEW HAM RADIO REMOTE CONTROL PRODUCT OFFERED

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-08-24 00:00:00 UTC
From: Marshall Craw <mcraw@halcyon.com>
Message-ID: <Pine.ULT.3.91.950824183339.3500A-100000@chinook.halcyon.com>
Source record: 41776
Cross-posted to: rec.radio.swap,rec.radio.scanner,rec.radio.amateur.homebrew,rec.radio.amateur.digital.misc

I am pleased to announce a new product offered by Positive Time Systems called the RCS-I. This is a radio controller that connects to any VHF/UHF transceiver and can issue x-10 commands. (X-10 is a power line standard for controlling devices throughout a building. Sears, Radio Shack, and others offer these compatible units)
The unit also has an alarm input, a listen feature, a short voicmail box, and responds to all commands in a pleasant female voice. The system IDs with your recorded voice and call sign. This description doesn't do the product justice, so please check out the new homepage at :

http://www.halcyon.com/pos.time.sys/top

or you may email us with you address so that we can promptly send you our brochure and newsletter.

NOTE: This product is intended for US voltages of 120 / 220 VAC. Another version is offered to support other international power standards.

FLASH! NEW FEATURE! The RCS-I has a new feature called Secure Access Mode(SAM). When enabled, the access code changes dozens of times per hour, making it virtually impossible to hack into.

This Product will work on other radio services like GMRS. Marine and Business bands!

Thank You,

Marshall Craw <mcraw@halcyon.com>

3793. KaWin 6.04 available on www & FTP

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-08-24 00:00:00 UTC
From: stan@mutadv.com
Message-ID: <41i13b$qa4@news-2.csn.net>
Source record: 41779

KaWin version 6.04 includes fixes to all reported bugs and is available for download from the KaWin Home Page or FTP Site, below.

The author of KaWin will be off the net and on vacation until 25 September. If you have questions re KaWin bring them to the rec.radio.amateur.digital.misc newsgroup - many experienced KaWin users read this group.

Caution: While KaWin is fully functional, it does include a truly draconian nag-meter. If you can't cope with a nag-meter while you evaluate a program, stay away from KaWin (and don't flame me about it ;-)

Bruce Walzer (bwalzer@lark.magic.mb.ca) wrote:

: I don't think that the gunplexer link can do full duplex anyway. You are
: modulating the local osc to send the data so I expect that you'd see the
: data you sent coming back at you. The N6GN system would have to have
: circuitry added to cancel out the transmitted data on receive.

: What I just said is true right? I've seen so many references to full duplex
: gunplexer links that I'm starting to worry that I might be out to lunch on
: this.

Bruce
Yes, you are correct. While I think it is possible to remove
the sending end's modulation in its own receiver by counter-modulating
the second LO to null the modulation of the first LO, I have never proven
this. Doing this prior to detection is probably the better method.
If one can get a factor of 10 reduction of the outgoing modulation by
this kind of cancellation, which I think is likely, it is probably
enough to keep the BER in bounds on anything but a very marginal C/N
signal which you wouldn't want to be using anyway.

In a more general sense, I am not nearly as enamored with full duplex
on radio links, particularly at higher speeds, as others seem to be. My
contention is that it is almost always easier/cheaper to increase the
channel speed by a factor of 2-4 and pick up the added capacity than it
is to try to make duplex work well in an RF environment. I feel like
this is another one of the areas where trying to map wireline behavior
onto radio is not the best solution.

However, for the diehards, I think it is practical to use a Ma/Comm
Gunnplexer or other electronically tuned transceiver instead of the
cheaper bias-push tuned ones I showed in the articles along with a
standard Ethernet Card at a full 10 Mbps (and I'm still suspicious that
Ethernet cards *can* be slowed down by someone who wants to take the
time to figure it out).

But before doing this, I'd strongly suggest that a thorough
examination of the effects on the system be made. Even at only 230 kbps
on the existing radio links we are running here, I find that overheads
and latencies *other* than the raw channel are quite significant. On
the 386DX40 switch/routers we use which have only ISA disk controllers
in them, I find that ftp throughput via radio over a single link is
likely to be at least half that of an ftp from a host to itself. It
appears that disk and disk controller performance is significant. No
doubt this could be improved by better controllers and disk hardware but
I mention it to give a practical example. A factor of 10 increase of

the radio channel would probably improve things for us by more than a factor of two. I don't think running FDX would give us that much improvement for most of our applications.

Just increasing radio speed or going to FDX is by no means a panacea and may be a waste of time and money unless other issues are carefully dealt with first.

Full duplex at RF and at higher speeds is increasingly an uphill battle. Radio complexity and coordination becomes more and more difficult, particularly at higher speeds. Wider channels offer a wider target for QRM, spurs and intermods as well. Microwave and narrow antenna beamwidths mitigate this somewhat but the increased complexity of FDX continues to be expensive, usually more so than the cost associated with simply inceasing channel speed.

>had only 1 entry for california.

Try 145.01, .03, .05, .07, .09, 145.61, .63, .65, .67 and .69.

Most packet frequencies in Southern California are "infested" with
bulletin boards -- finding one shouldn't take more than 5 or 10 minutes
of monitoring.

Whats the best source, setup method, and what do I have to have in hardware to run it. I'm also going to setup a 2m packet rig with APRS, so suggestions on that would also be appreciated. I already have the Jpole setup for voice on the bike, a 'dale H400, but if someone has a bright idea for packet ops for 2m on 2 wheels I'd appreciate all suggestions. Local area of operation will be in OKC, if that is a factor for APRS.

3803. tcpip on a baycom?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-08-24 00:00:00 UTC
From: tjohnson@csgrad.cs.vt.edu
Message-ID: <41jeld$3rs@csgrad.cs.vt.edu>
Source record: 41789

Hello...
I just got a baycom modem, and have been playing with it on my toy Dos box. Now, I'm trying to attach it to my HP running NetBSD. After much searching, I found a single reference to a program written by Pawel Jalocha (SP9VRC) (jalocha@chopin.ifj.edu.pl) which is aparently a packet driver so KA9Q and friends can talk to a baycom modem through the FTP packet driver interface. Then I could put the baycom modem on a dos box with either an ethernet board or a slip line to the unix box, and be happy (though this is a bit of overkill...). The only problem is that I can not find this program. The filename is supposed to be AX25DRV.ZIP, and I have tried every archie-type thing I could find, but no dice. Does anyone know where to find this? Or perhaps a more elegant solution to putting a baycom on a unix box?

Hello,

One of my colleagues wishes to set up a spread spectrum data link on UHF between his home and our club node/bbs site. I'm quite happy to leave him to do this (and liase with the licencing authority !), but would like to do some background reading in order to be better placed to assist.

Would anyone like to own-up to knowing of suitable publications or internet resources describing spread-spectrum techniques ?

Many thanks,

Cheers,

Gareth.

This MIGHT be a tad overstated.... But not much. We put up a 9.6K
full duplex machine here in Ct over a year ago, (hardly the cutting
edge of the technology) So far except for the 4 or 5 guys that helped
set it up and get it going there has been ONE new user. The common
complaint? 9.6K is too difficult to setup and requires some investment
and modification of equipment. A poor testimony to the technical
abilities of the hams in our area. Most of 'em seem to be totally
satisfied running 3:1 retry rate, 1200 baud on simplex channels and
accessing the bbses. Is it ignorance or apathy?

3815. Ultimate Packet Station

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-08-25 00:00:00 UTC
From: kwalton@bbs.gemlink.COM
Message-ID: <80931354881016@bbs.gemlink.com>
Source record: 41702

I am fairly new to packet radio. I currently use an ICOM IC-u2AT and the BAYCOM packet modem with my IBM PS/2. I've never been able to get into the local node with much regularity. Even the slightest frequency congestion will keep me out. I am in a townhouse development with ext antenna restrictions. How about some help? "If you were me ..." how would you set up your station? I'd appreciate your help & feedback. Thanks & 73's - N4RMF / 9M2ZZ / YL/N4RMF / AFA8FX -- Kevin

3816. WNOS: Timeout errno 9???

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-08-25 00:00:00 UTC
From: forg@cent.gud.siemens.co.at
Message-ID: <41jnnt$c8b@siemens.co.at>
Source record: 41703

Hi,
I am using W-NOS.950216.dama_slave (Feb 16 1995) now for a short while and
I have setup all the neccessary files to be able to establish sessions to
a "NOS-ham" in my neiborghood.

Now I got some TCP/IP-addresses from countries at the border of Austria,
like HB9 and DL and I want to try to get in contact with them via ftp or
telnet.

But I have no success with establishing a IP-link to this stations because
after a short while my server brings up the following messages:

Telnet session failed: Timeout errno 9

and terminates the session. - The interesting thing is that ax25 still
tries to establish a contact to this station. Normally I get a ax25-link
after a while and the server are exchanging informations but no
session will be opened to make this link accessable for me. (I found
this out by using the TRACE-window).

Any WNOS-wizard out there who can give me a hint - perhaps there is somewhere
a timer which can be modified????

any help apreciated, 73 de Gerald/OE1GOU/oe1gou.ampr.org

Has anyone tried getting the Baycom modem to work in WIN95? Mainly
AX25.COM ??

Anything concerning tcp/ip and packet is usually someplace on:

ftp://ftp.ucsd.edu/hamradio/packet/tcpip

Also check the incoming directory for new stuff. The sysadm usually cleans
out the incoming once a year, so it's pretty full with the 12,000 TNOS posts
the last year.

> Or perhaps a more elegant solution to putting a baycom on a unix box?

Hell no.

P.S. tcp/ip really sucks at 1.2 kbps, but it can be done.

Find a friend you can point a beam at (UHF is pretty small and can be hidden)
and have him but a UHF/VHF node up for you. Together you can learn a lot
about how these switches work/don't work, and enjoy the pastime. Make it
9600 with a couple of TEKK radios.

: satisfied running 3:1 retry rate, 1200 baud on simplex channels and
: accessing the bbses. Is it ignorance or apathy?

Well if it's any consolation, things are just the same, if not worse, over here in the UK; I have just given up running my BBS here (TCP/IP) having kept it going for a couple of years with fewer regular users than it takes the fingers of one hand to count! I built a 9600 baud TNC, converted the radio, and had not a single user come on.. in the end I swapped the 9k6 gear for a SCSI tape streamer!

At the same time the local "regular" BBS is swamped with users on 2 metres downloading enormous .GIF files of their sports cars, pets, etc.. at 1200 baud on a congested channel.

I give up! .. or should that read "I have given up!"

Cut out the middleman. Pick up the phone, dial 001 203 666 1541, ask for ARRL bookshop, ask for publication #3177 "ARRL Spread Spectrum Sourcebook", give your MC/VISA number and wait about a week.

Free - Latest Release of Macintosh TCP/IP software for Amateur Radio

version NET_Mac2.3.54

For those who don't know NET/Mac... NET/Mac is the application that
supports TCP/IP over packet-radio, which means, that hamradio operators
can use NET/Mac for their wireless TCP/IP network...

In this version of NET/Mac the following mods/features were implemented:

- 'netmacicons' now also defines the icontype of 'source'-files
- <hostname>.<domainname> is now the same as <hostname>
- Added a mailfile-size-limit to the popmail command
- Added command 'domainname'
- Some cosmetic mods for netmacicons
- NET/Mac does NOT support the new Buckmaster CD-ROM's HAMCALL
database yet... I am trying to convince Buckmaster that I need
the new data-encryption-method, but as of yet they are not ready
to release a description of the encoding-algorithm...
The old CD-ROM's remain fully supported...

This version obsoletes all versions of info-mac/comm/radio-net-mac in
the Sumex-Aim.stanford.edu (and it's mirror-) archives.

The new NET/Mac has (hopefully) been uploaded to:

- oak.oakland.edu, to the directory /pub/hamradio/mac/digital
- ftp.ucsd.edu, to directory /hamradio/packet/tcpip/incoming.
If it's not there (anymore), then look at /hamradio/packet/tcpip/mac.
- hamster.business.uwo.ca, to directory /pub/amsoft

NET/Mac includes interactive HELP if you are just starting out. I also include
a TCP.FAQ (Frequently Asked Questions) that even includes names and addresses
of regional gurus and a "by the numbers" list of what you do to get
operational.

Send me (1) one formatted disk and a *self addressed and *stamped disk mailer
marked TCP/IP... 800k or 1.4 Meg disks are OK but they MUST be formatted.

RTDX0825 RTTY DX
VK2SG RTTY DX NOTES (NR.851) FOR WEEKENDING 25 AUG 95 (BID RTDX0825)

According to a widely disseminated report by Paul, NA5N,
at the National Radio Astronomy Observatory at Socorro, NM
the next Solar Cycle began on August 12, 1995 when the Big
Bear Solar Observatory operated by Cal Tech, observed a
sunspot at 21 deg. north latitude, with a magnetic polarity
opposite from all sunspots observed since 1984. This
latitudinal position, and polarity difference satisfy two
astronomical criteria for the end of one cycle and the start
of a new one. This is a bit ahead of most forecasts. Paul
opines that improved HF propagation could be evident as early
as next spring or summer, depending upon the rate of increase
in solar activity. Some experts are disputing the conclusion
that the new cycle has started. KYFC.

Our information this week comes from DJ3IW and the DB0SPC
Central Europe Cluster, I5FLN and the IK5PWJ Packetcluster,
JF1MGI/5R8EU, WA6HHQ, WB2CJL, W5KSI, ZS5S, and the NJ0M Node
of the Minnesota DX Packetcluster Network. Thanks to all.

Notes of Interest:

The final plans for the Easter Island and Salas y Gomez DXpedition are in place. XR0Y on EI will be QRV 5-21 Sept. XR0Z on SyG will be QRV 7-11 Sept. This is an all band, all mode venture. RTTY frequencies are as follows: XR0Y - 3680, 7080, 10108, 14080, 18102, 21080, 28180. XR0Z - 3590, 7090, 10104, 14090, 18109, 21090, 28190. Real signal reports are requested. This expedition will experiment using state-of-the-art digital technology to enhance communications from remote sites. QSL Manager is WA3HUP.

Due to professional commitments in Japan, the trip to Madagascar by Shun, JF1MGI/5R8EU, originally scheduled for August/September, will take place in October or November. Watch these Notes for updated information.

The VK2SG RTTY DX Notes are also available on Internet via Telnet or FTP at ab6z.ampr.org and reflectors dx@ve7tcp.ampr.org and digital-dx@st.rim.or.jp See also the OH2BUA WebCluster at URL http://www.clinet.fi/~jukka/webcluster.html

TO ALL THOSE ATTENDING THE NEW ORLEANS DX CONVENTION THIS WEEKEND...H A V E F U N !!!!

For next week's bulletin send your bandpass and notes of interest to Luciano, I5FLN at ZS5S.ZAF.AF

Well, I have to somewhat echo that sentiment. I'm in the process, albeit
slowly, of bringing a KPC-9612 on line. I haven't invested much time in
it since I'll have to use my FT736-R initially until I can get some
dedicated gear for packet. But, a couple of the stumbling blocks that I
learned in WM5K's talk at the NE Division ARRL Convention up here in July
is that you need to adjust the levels carefully to get the right deviation.

I suspect that's true, especially on a busy 2M channel. However, I don't
have $2-3K for a Service Monitor and/or spectrum analyzer to make the
right tweaks. Although the Kantronics documentation is very thorough,
there still appears to be room for error, and those errors can affect a
lot of other people aside from the user. Basically, the unmodulated
center frequency has to be dead-nuts on, and the deviation has to be
set to ensure that the spectrum at 9600 is shaped correctly and fits in
the 20 kHz channel (ideally) so that the reciever see what it's supposed to.
(And, of course, this assumes that the rig can run at 9600 - mine will,
but others will be justifiably nervous about certain modifications if
they can't see what the effects are.) Given the right test equipment, it's
probably very easy to do right.

Maybe we could get the FCC (or whatever in your country) to open up a couple of 'experimenters' bands. You know, some band(s) where guys that have a technical interest in radio and various communication methods could get on and share ideas and test new concepts and designs... Nah, they'd never go for it...

I believe that ARRL do a spread spectrum handbook. It apparently isn't
one of those carried by RSGB (according to latest Rad Com). If you don't
get an answer here, you could try asking on rec.radio.amateur.misc.

It sounds interesting - can you let us have any more information?

Zilog have got a chipset and an adapter board developers kit for the
ZNW2000 PC WAN card (equiv. to Eagle's NW2000). It has RS-232/422 & V.35
connections and supports up to 2Mbps. I don't know the price.

Didn't N6GN use an old IBM PC Lan Card (1Mbps)?

What about Arcnet?

: Hello,
:
: One of my colleagues wishes to set up a spread spectrum data link on UHF
: between his home and our club node/bbs site. I'm quite happy to leave
: him to do this (and liase with the licencing authority !), but would like
: to do some background reading in order to be better placed to assist.

I don't know about England, but here in the US, we are allowed to operate Spread Spectrum on any ham band above 420 Mhz., using up to 100W output, although we are limited to 3 distinct spreading code (for direct sequence). There is a current permit (special temporary authority) that once part of it, lets you do spread spectrum between 50 and 420 Mhz. as well, and removes the silly restriction on the spreading code you use.

In addition to the ham bands, it is also legal for anyone to set up any kind of spread spectrum between 902 and 928 Mhz. (1 max output/unlicensed). England might have something similar (?)

: Would anyone like to own-up to knowing of suitable publications or
: internet resources describing spread-spectrum techniques ?

Check out http://www.sp.nps.navy.mil/ss

He has a pretty good description of what spread spectrum is, and also some bibliographies (right off the main page). If you are looking for a more practical approach, you might try the Spread Spectrum Sourcebook (not sure if it's part of the bibliographies mentioned.
:
: Gareth.

Let me know if you need additional information..

3832. Packet Software for Atari ST & PK232MBX?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-08-26 00:00:00 UTC
From: joneil@infi.net
Message-ID: <41mc5o$nfk@allnews.infi.net>
Source record: 41719

I'm looking for software to run my AEA PK232MBX with my Atari ST520
system. I've checked most of the Atari FTP sites and a lot of the
packet sites without luck. Any suggestions?
Please respond by email if possible. :-)

Thanks!
John O'Neil

Check this out - QSL cards!

With your own custom graphics, and text...

only $5.95 for 50!...

Custom design your cards with up to 80 Characters of text, and Your own scanned
graphic / or antenna graphic.

Just fill out the following form, and send with total (check or money order) to:
Shaun Qualheim, KB8RJY

QSL cards

Dept. BBS

224 Cherry Creek Road

Marquette, MI 49855

(Print, and cut here:)

Order Form: QSL Cards

Front Text:

(up to 80 characters on front) - back will have standard QSL reply fields.
Is a graphic/photo to be scanned included? (yes/no) ____

Do you wish to have the antenna included on your qsl card instead? (yes/no) ____
Number of sets: (50 in a set, $5.95 a set) ____ times $5.95 = ____

Plus Shipping and handling: ($1.50 per set) ____ times $5.95 = ____

Plus Scanning fee ($1.00) ____

TOTAL (sets + s & h + scan fee)
=____

(cut here)

Thank You

3836. HF Forwarding paths

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-08-26 00:00:00 UTC
From: robinarna@aol.com
Message-ID: <41n3mg$d41@newsbf02.news.aol.com>
Source record: 41723

Hello packeteers,

Packet operators in south Florida should have learned a lesson a year ago when the only HF-forwarding packet BBS in the area took a direct lightning hit.

In an area so prone to storms, and sitting right in the path of hurricanes, you'd think there'd be more than just one HF-forwarding BBS in the area, wouldn't you? You'd think that after the catastrophe of last summer, and looking at the parade of tropical storms marching across the Atlantic towards the area this week, that local sysops and node-ops would be agreeing upon a few alternative HF-forwarding paths, wouldn't you?

Nope. It's profoundly stupid, but there remains only ONE HF-forwarding plan for the area. If the N4HHP BBS is taken out again by lightning, wind, or whatever, messages into and out of south Florida will once again be lost or delayed.

Why? Because N4HHP likes being the center of the ham radio universe in Broward county, Florida. Even when it doesn't make any sense, he is able to get others to do as he wants. It's like he's running his own little cult in Broward. President of a ham club and doubling as RACES officer (which he uses to promote his club), he has more than his share of control over policies that affect the area. A certifiable megalomaniac driven by an adolescent need to be the center of attention, he will allow no other HF-forwarding path for the area.

Lots of good folks in south Florida know this doesn't make any sense, but most are not on packet, or have given up on the area in the face of the growing "cult" of personal followers that pander to N4HHP's ego.

So when the next hurricane threatens, and packet users try to help, the mistakes of last summer could multiply into a disaterous boondoggle, making Broward county "a black hole" for emergency traffic once again, just as happenned during the Andrew emergency and again last summer.

Good luck, south Florida!

-Robin Arnaud,
KD4ELI
former resident of south Florida and victim of the local madness

: methods could get on and share ideas and test new concepts and
: designs... Nah, they'd never go for it...

We already have that in the US! Part 15 bands at 160-190 Khz (yuk!),
some frequencies at 46 and 49 Mhz (not so much yuk, but really low
power), 902-928 Mhz. (up to 1W out with spread spectrum - this is the
ideal experimenter's band - too bad it's not a bit further down in
frequency, though), and a 2 microwave bands.

: on 2 meters before they'll even use it. That and a C-64...

Which is why I found that the best way to actually get something done is
not necessarily to work with everyone else but to find a small group of
people with a common interest and just put it up for yourselves. If others
would like to use what you have, then let them. If you went and put up a
microwave network around town and it was built by a small closed group
of people, and if there was a 9600 network around town built by a large
group of people all working together (the best they could do is 9600),
and then you stated that if anybody wanted to "hitch a ride" on your network
you'll probably find that a lot of people won't want to use yours because
of various reasons... It's something foreign to them (they are used to
2m/220/440 at common speeds), it's not built by "their group", it actually
works and they have nothing to complain about, and probably other various
reasons.

I quit trying to work with everyone since years of experience has shown
that it always slows down progress when too many people get involved. I
have a few friends that I do experimenting with now and we can do anything
we want anytime we want and not have problems anymore. If you want to put
up a decent packet system just figure out what you want to do with it,
find some friends with the same interest, and put it up for yourselves
and use it. Feel free to offer it to others, but don't push it on them
and try to get them to use it. And it nobody else wants to use it because
it looks strange to them, so what, more bandwidth for you.

Ron

Friday, September 8th, 1995

3:00pm - 6:00pm Registration opens at 3pm (foyer)
4:00pm - 7:00pm APRS Workshop, Keith Sproul, WU2Z

Saturday, September 9th, 1995

Times inside each session are approximate. Each session will begin on
time. Time will be available after each presentation for limited
questions from the audience depending on the amount of time used by the
presenter.

8:00am - 5:00pm DCC Registration (foyer)

8:20am Welcome, Dave Wolf, WO5H & Greg Jones, WD5IVD

Session 1a * 8:30am - 10:10am Room: Johnson Station
8:30am AX.25 Transport Layer Drivers for TCP/IP
Mark Sproul, KB2ICI [p. 119]
9:00am NETMGR: A Graphical Configurator for ROSE X.25 Networks,
Donald Rotolo, N2IRZ [p. 101]
9:30am TAPR/AMSAT DSP-93, Frank Perkins, WB5IPM [p20, 27, 97]

Session 1b * 8:45am - 10:15am Room: Mill Creek
8:45am Introduction to Digital Communications, Jim Neely, WA5LHS
9:15am Introduction to HF Digital Communications, Johan Forrer, KC7WW
9:45am Introduction to Packet Networking, TBD

Session 2a * 10:30am - 12noon Room: Johnson Station
10:30am Convolutional Decoders for Amateur Packet Radio,
Phil Karn, KA9Q [p. 45]
11:00am Modeling Some Data Communications Functions Using Excel,
Tom McDermott, N5EG [p. 56]
11:30am Data Radio Standard Test Methods, Donald Rotolo, N2IRZ [p 51]

Session 2b * 10:30am - 12noon Room: Mill Creek
10:30am Introduction to APRS, Keith Sproul, WU2Z
11:00am Introduction to TCP/IP, John Ackermann, AG9V
11:30am Intro to Satellite Communications, Robert Diersing, N5AHD

Lunch * 12noon - 1:30pm Room: Arlington Downs

Session 3 * 1:30pm - 3:30pm Room: Johnson Station
1:30pm An Introduction to FlexNet, Gunther Jost, DK7WJ [p. 37]
2:00pm Building a Packet Network & DAMA, Karl Medcalf, WK5M [p. 65,73]
2:30pm The Tulsa NWS TexNet Interface Project, Bob Morgan, WB5AOH [77,86]
3:00pm Graphical Information Systems and Ham Radio,
Keith Sproul, WU2Z [p. 108]

Session 4 * 3:45pm - 5:00pm
Room: University Hall
HF SIG / HF Digital Issues, Conducted by Johan Forrer, KC7WW
Room: Rush Creek
APRS Topics and Issues, Conducted by Keith Sproul, WU2Z
Room: Johnson Station

There already is an service in existence here in the USA like you
describe above that was setup by the FCC years ago. Its called Part 5,
the Experimental Service. By filling out an application and paying a
small fee, you can get a license from the FCC to do experimentation just
about anywhere in the RF spectrum. Check it out.

>satisfied running 3:1 retry rate, 1200 baud on simplex channels and
>accessing the bbses. Is it ignorance or apathy?

Ignorance, apathy, and *fear*. Like those hams who are afraid to
drill a hole in their cars to mount a proper antenna, there are
many hams who are afraid to modify their radios from pristine
factory condition. Many of those who *will* do a modification
will only do so if they don't have to drill a hole in the case.
It's pathetic really, this fear of drilling holes. There's probably
a Freudian comment on amateurs in there somewhere. :-)

There's also fear of displaying ignorance. Many hams seem to
think they showed they knew it all by passing an exam, and
don't want to admit there are things they don't yet understand.
So, you'll find Extras afraid to ask how to modify their equipment
for 9600 baud packet because it might seem that they don't already
know it all.

Apathy is also coupled to ignorance and fear. Many hams who have
experienced 1200 baud packet applications are apathetic about
higher speeds because they don't know how much more useful higher
speeds are, and what new applications become practical at higher
speeds, and are afraid to ask or explore. If the current crop
of BBS applications were all there was, I'd be apathetic about
higher speeds too.

Cynical, but close enough to the truth to hurt.

Sadly, too many hams have their heads firmly turned to the rear
(one is tempted to say "up" their rears), and aren't interested
in newer or better ways to communicate. Re-enacting the past is
all they can imagine doing. That shouldn't stop the rest of us,
but it too often does. Especially in networking, a cooperative
group is necessary, and if you can't recruit the necessary critical
mass, you won't get a viable network going.

>can't find them anywhere! Can someone please enlighten us?
>
Two standards are popular:

Bell 202 : 1200 & 2200 Hz
CCITT V.23 : 1300 & 2100 Hz

Most decoders can receive either set. The 202 tones are used almost
exclusively in the US. Data is transmitted using NRZI (0 = transition,
1=no transistion) and AX.25 protocol. Because of the NRZI, it is not
necessary to define one tone as "1" and the other as "0", constant
signal inversions in the data path will be ignored by the receiver.

I'm having trouble with my calculus...

The derivative of JNOS is NOS, and the derivative of NOS is
NET. So working backwards I find, the antiderivative of
NET is NOS, and the antiderivative of NOS is JNOS. Where
I'm having problems is that the antiderivative of JNOS keeps
coming up with Nintendo??

Hell of a formula...

I must be missing something here, why not just *use* ProComm?
It's a perfectly good terminal program.

Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc

Hello,

I have a friend with one of these radios and he would like to
build the interface and program his own computer to control the radio.
The only problem that he has is that he cannot find the protocols that
the radio uses to be controlled. He would like to get the information
that is needed to make the radio listen to the computer commands. He is
most interested in the data bits and the baud rate and what the actual
commands are that need to be sent out the computer serial port.

Please respond via E-mail and here if you have an answer to this.
He realizes that he could do the solution by throwing money at the
problem but he wishes to do it the old fashioned way and do it himself.

Hope this is the correct group!
I m seeking advice for a friend, I know the internet, he knows amatur radio. I know there are radio BB's. BUT are there means of gaining access to the internet using amatur radio. He is based in south england hes got a big ariel and lots of interesting looking boxes (I know NOTHING about amatur radio,as you probably have guessed) He has a license ? hes got no voicebox so cant speak so he uses Bardot?
I hope this is making sense to someone. anyway if anybody has details or knows where to look for info then PLEASE Email me as I have no interest in this group.Thanking you in advance. MIKE

I'm not sure what your looking for here. I don't believe there's any
host mode software for any TNC for Linux available as of yet. But the
Kernel AX25 kiss support works very well. I'm pretty sure your TNC can
do kiss.

3861. Looking for Mfr of fire/explosion detectors that transmit by radio

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-08-27 00:00:00 UTC
From: rmjackso@intersource.com
Message-ID: <41q1fi$ali@ansel.intersource.com>
Source record: 41738

Scenario:
A business currently has in place approximatley 350 fire dectector stations that transmit on a frequency back to a central location. They are old (tubes are still used!). They have self diagnostics and transmit two (2) seperate type codes/frequencies. One is in the event of fire another is a noticification of an abnormality (i.e. broken wire/failed self-diagnostics). They transmit an identifier also so the location is known. This transmission in turn lights up a red light for a fire or a yellow light for a diagnostic problem.

Is anyone aware of a company that sales this type of equipment?
Are books available on the design of this type system?
etc...etc..etc...

What questions am I not asking that's needed to be known? (outside of frequency)

Thanks in advance.

From: Tom Williams <williamt@ccmail.orst.edu>
Message-ID: <41t362$lbq@news.orst.edu>
Source record: 41564

Hello all:
I am just now getting back into 'packet' radio experimenting (I currently operate a working node, but it has been steady state for about 4 years) and while reading about all the new high speed stuff, I keep coming up with the same problems, I hope somebody can straighten me out on these points:

Medium / high speed (>=19k2)
When I look at the math, it seems to me that with "standard lenght" packets, the overhead delay can become a significant fraction of the total transmission. Even to the point where overhead exceeds certain packets. If we were to have "super" packets of several standard frames muxed together transiting between each node, and active switching the overhead would drop back to reasonable percentages, assuming of course that the BER will suppport the packet lenght.

Adaptive path qualities:
In our current network path qualities are manualy set, frequently with bad values, which can bog down the network. Has anyone done some work on adaptive route qualities where the soft/firm ware crunches the RTT vs RTR% and comes up with a dynamic value?

Adaptive packet lenghts?
Lets face it, when a path (maybe the only available one) has a BER that is say 1 err/500 bits there is no way that a 80 char line is going to get through. most likely the retry is going to get clobbered also. This would also apply to my first item above. Has any body developed a system where dynamic packet lenght control is used?

Automatic checking account debit :
Some way to get adequate funding for a network that works.

Sorry about the above, but my node is 99.9% backbone traffic and 0.1% user port traffic, and I have a hard time getting help to pay to keep it on the air.

Have fun, stay safe 73

Only 1000? Sorta hard to sample 1200 bits/sec with only 1000 samples. This
is the core of what is wrong with Baycom-style modems, they trade CPU time
for reduced hardware and as a result have to be much closer to the
hardware of your system. When the OS has other ideas about CPU
utilization, Baycom breaks.

: There already is an service in existence here in the USA like you
: describe above that was setup by the FCC years ago. Its called Part 5,
: the Experimental Service. By filling out an application and paying a
: small fee, you can get a license from the FCC to do experimentation just
: about anywhere in the RF spectrum. Check it out.

: -- Dewayne

My point was not that the UK licence does not allow exprimentation (in fact
it is just the opposite - the wording is (deliberately?) vague and only
specifies a few limits, such as frequency band and the NEED to transmit the
station ID using a recognisable mode (to allow the authorities to find you
and close you down when you are causing interference to other services)..
there -is- a huge amount of freedom to experiment.

Quoting from the UK licence "Conditions of Use"..

Purpose
1 (1) The Licensee shall use the Station for the purpose of self-training in
communication by wireless telegraphy, which use (without limiting the
generality of the foregoing) includes technical investigations.

So the problem isn't that "we" can't experiment.. just that "we" -won't- !

As Gary KE4ZV said, a lot of amateurs are either scared to modify their
shiny black box, or have never experienced anything other than 1200 baud
packet and don't know what else is out there!

Subject: CCTSS: what is it?

>>Anyone know about an identification technique using audio tones and
>>referred to as CCTSS?

Sub-audible tones are used to open squelch on receivers. Or repeaters.
You might want to think of them as "channels" on the same frequency - as
one frequency/repeater can have several CTCSS tones, enabling differenty
agencies/entities to access the machine.

Well, I made the jump to 9600 baud - bought a new 2m rig with 50 watts out, put up a better antenna, put in a KPC 9612. Now what? I've been hearing about how great 9600 baud is for the last year, so I made the move to 9600. Now the only thing I find is the same BBS's at a faster data rate - hardly enough to cause me to jump for joy. Isn't there anything more interesting going on out there at 9600?

I get the general feeling from reading messages that moving to tcp/ip is alot better. Before I go to all that trouble, I'd like to hear some examples of what there is out there. Is anyone doing anything truly interesting at 9600? I'm interested in hearing comments. I'm sure that there must be something that I'm missing or not aware of...I just haven't found it yet.

The October 1984, AX.25 Version 2.0 is the current version. The world of amatuer packet radio link-layor protocol has basically been frozen in time since then. A number of possible solutions have been proposed over the years. One of which was the A802, Metropolitan Area Network Protocol for Amateur Packet Radio, advanced in 1988 at the ARRL Networking Conference by Fred R. Goldstein, K1IO. This protocol is a dirivative of the IEEE 802 committee family of LAN networking protocols, 802.3, Ethernet, 802.4, Token Bus, and 802.5, Token Ring. In 1993, Phil Karn, KA9Q, the creator of NET/NOS TCP/IP software for ham radio, proposed a FEC/ARQ hybrid replacement for the link-layer. Hopefully we'll find something soon that can deal with noisy, busy channels and still get the data through.

Hi!

I am currently designing a 10 megabits/second digital data link for my final year Electronic Engineering project (I am a student at the University of Stellenbosch).

I am envisaging the use of Gunn transceivers to accomplish this, and my choice has fallen on the MA87127 or MA87125 from Microwave Associates. The data sheets for these indicate that they are "low cost", however I have not been able to obtain them locally at a reasonable price and within a couple of weeks (I am rather pressed for time).

If anyone knows how to get hold of these quickly or has a couple of used ones lying around (and you are willing to sell them), please let me know.

Thanks

3895. EMDRC Balloon Launch #3, 16th Sept

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-08-29 00:00:00 UTC
From: FFRONT@ibm.net
Message-ID: <NEWTNews.14047.809765391.ffront@ibm.net>
Source record: 41579
Cross-posted to: rec.radio.amateur.digital.misc,aus.radio.wicen,aus.radio.packet,aus.radio

EMDRC 1995 Balloon Launch No3.
==========

At 10AM on Saturday the 16th July 1995, the Eastern and Mountain Districts Radio Club will be releasing a Helium Balloon from the Vermont South Shopping Centre Car Park, Burwood Highway Vermont, Victoria, Australia.

The payload will be transmitting on 144.250MHz FM at a power level of approximately 100 milliwatts The Balloon is expected to reach an altitude of approximately 20KM before bursting. The payload should be able to be heard in VK2, VK3, VK5 and VK7. The EMDRC encourages as many people as possible to record the transmissions on tape or (preferably) by logging the packet data to disk. A program will be distributed to analyse the data and concatenate results from multiple sources.

Telemetry will be sent in both 1200 Baud Packet and Voice identifying itself as VK3ER and will send the following information:

1) Flight Time
2) Altitude
3) Internal and External Temperature
4) Background Radiation Count
5) Global Position (see note)

The voice and data transmission will repeat approximately once every minute. Data packets will be sent as UI frames, repeated four times for data redundancy.

When the payload returns to ground level the transmission power will increase to approximately 2 watts for 5 seconds every 60 seconds. This will aid in recovery of the payload once it reaches the ground. There is a $100 prize for the person who recovers the payload. The global Positioning data is subject to the availability of a GPS receiver before the launch. Although the interface has been included, at this stage the GPS looks doubtful. We will need to rely on the expertise of the "foxhunters" to track the location of the payload and its recovery. We encourage anyone who feels the urge to hunt it. All you need is a 2m receiver, some sort of simple attenuator (20 db steps up to 80 db should suffice) and a simple vehicle mounted 3-element beam.

A Short presentation on the launch will be given at the next EMDRC Club Meeting, Friday, 1st September at 8PM. The location of the meeting is the Willis Room, City Of Whitehorse Civic Centre Maroondah Hwy, Nunawading. The meeting will start at 8PM Sharp. The rest of the evening will be a presentation on Internet by David Tilson, VK3UR.

All are welcome.

Jake> directions and or sites would be appreciated.

I asked this question a month or two, and the end result of all the information I got was that it isn't possible. I began pursuing alternatives, and I think the most cost-effective route would be to get an SCC-based card like the OptoSCC. If you had an OptoSCC, you could probably use the Baycom modem. I _think_ that all this would require would be a current loop interface, and perhaps some _minor_ modifications to the modem.

Unfortunately, I'm having trouble obtaining an OptoSCC (the card I think I'd like best). I have the schematics, and I think I could create trace artwork, but I can't find a source for the program for the PAL required for address decoding, and while I _think_ that it should be possible to substitute something else, I'm not quite up to figuring it out.

transmission.

Overhead is the least of the problem: TXDelay can eat up quite a bit more. Of course, the amount of overhead depends upon the protocol (TCP/IP has lots, for example, and ROSE has the least). TXDelay depends upon the radios used. The Kantronics D4-10 is pretty good, as are the TEKK radios (only 2w tho...) Converted commercial units can be awful.

Yes, in Germany the network uses software called FlexNET, written by Gunter Jost DK7WJ. The only parameter you (sysop) can set is TXDelay, and even that is watched for excessive length by the software. All the other parms adapt to the current channel conditions, using quite ingenious algorithms. FlexNET runs primarily in the RMNC hardware, a 6809-based system, but also is available for the PC. It is modular, in that the main program uses channel drivers to interact with whatever hardware you happen to have. There's a paper about it in the proceedings of this years DCC being held in Dallas.

If your level 1 network is properly constructed, this is not a problem.
Dedicated point-to-point links are the rule.

>

> Some way to get adequate funding for a network that works.

A network that works supports itself. users see what works and what doesn't,
and support follows.

The backbone traffic: who is sending it? Are you spending your money to
support the BBS world? Get some $upport from them!

It's not any better. When people talk about TCP/IP they are usually
talking about JNOS. What that means is putting up a BBS more than having
a TCP/IP client/server/router. If you could convince others to join you
and develop not only an email or chat thingy, but also to route packets
using TCP/IP, you may find the energy spent useful. In most cases you will
find that people are using JNOS IP packets over Rose or Netrom, and sucking
down BBS data to fill out the hard drive.

It may be a bit early yet. I think maybe in 10 years we should be ready for
everyone to have a Linux capability. I run Linux at home, I also use the
Alan Cox AX.25 kernel stuff (but I'd like to get rid of AX.25 totally and will).

If you want my opinion; I would recommend you get a Linux on the air. It's
real TCP/IP as opposed to xxxNOS BBS with incidental TCP/IP. It's full of
challenges, and can actually do real work (a software emporium of good stuff).
I think 3 or 4 users in town running 9K6 Linux connected boxes will have more
fun than all the 1K2 slack-jaws in the Universe.

Hello all...
We are having some troubles trying to get a MSYS bbs to forward to a Jnos site. We are trying to forward all mail to @LNET to the Jnoser. The MSYS bbs
forwards correctly, but when the bull gets to the jnos site, it forwards it right
back to the bbs. We are guessing there is a problem with the BIDs or maybe the
rewite files. Any suggestions would be great. Please reply directly to CMSuss@aol.com or JeffW2302@aol.com.

From: garym@alsys.com
Message-ID: <DE32tB.8ns@thomsoft.com>
Source record: 41588

I'm looking for suggestions on what radio to get for the 440 Mhz band for use on 9600 bps packet. I have an AEA PK-80 (TNC-2) that I'm going to install a 9600 bps modem on for the a local BBS <http://www.cts.com/browse/garym/races> and put it on 439 Mhz backbone here.

I've heard a Tek(?) radio mentioned, how about converting a Micor or Syntor or something like that? I don't mind drilling holes, modifying the radio, etc (as long as I can get a manual for it). Cost is a factor, and I can probably get a used Motorola UHF commercial radio for free from somewhere within our organization but I don't know which ones can be moved down to 439 Mhz (if any).

> is less than helpful. Can someone please tell me the command to turn
> this off?

Have him set "ILfpack ON" which should be the factory default. This tells the PK-12 to ignore all Incoming Line feeds. Or he can set his terminal program NOT to add LF after CR.

> I've never seen the thing, but I get the impression that it isn't even
> remotely TAPR compatible (like my own KPC).

Command set is close. I peeked inside a PK-12 once and it is not even remotely similar to a TNC-2, neither is the KPC. In fact I almost bought a PK-12 just because the PK-12 uses a Motorola 68HC11 rather than the Zilog Z80 in the TNC-2. I do a lot of 68HC11 work, have an excellent C compiler and Nohau emulator. Decided I didn't have was the time to make neat things out of PK-12's.

From: Steve Sampson <ssampson@icon.net>
Message-ID: <41u79j$pp1@news.icon.net>
Source record: 41590

This is a stupid idea. Even though it would be cheap in money, it is expensive in computer. (i.e., it sucks the whole CPU which is fine in DOS).

>>Yah, I'd be interested in this too. I tried running the L2 driver under
>>dosemu and it doesn't work at all (it doesn't work under Win95 either).
>>Probably has something to do with that fact that it wants 1000 timer
>>interrupts per second (why?).

Hmmm, let's see. The Baycom simulates a serial port using software. A serial port is fed 1 byte (8 bits) and it performs the translation to a bit stream. Now, simulate that wonderful serial chip in software, and you must send out 1200 bits per second. Hmmm, I wonder what the CPU will be doing while this process is taking place?

This is a wonderful idea for a DOS box that sits in the corner, but a stupid idea for a multitasking, multiuser OS. Hell, some consider context switching at 100 times a second as too much overhead...

3909. Digitized voice/data via mobile packet radio

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-08-30 00:00:00 UTC
From: kevinc@PROBLEM_WITH_INEWS_DOMAIN_FILE
Message-ID: <420t1s$jl3@news.scruz.net>
Source record: 41496

Hi there,

I am a hang glider pilot who dreams of someday making a record distance flight. One of the problems on a flight like this is maintaining contact with ones chase crew. Often, the road that the chase crew must drive diverges quite a ways from the path that the pilot is flying. Also, at times the hang glider can outrun the chase car. The result is that the pilot and chase crew could find themselves separated by a large distance with intervening hills/mountains. The 2-meter radios that we carry are often inadequate. In order to maintain safety margins in remote areas, the pilot must sometimes slow down or choose less than optimal routes. Many a pilot has had to spend one or more nights in the desert after losing track of his chase crew.

Another problem is determining the positions of both the glider and car. While I am planning on having a GPS receiver on both, it is difficult to plot ones position on a map while driving a car and worse while flying a hang glider.

I've come up with a somewhat grandiose scheme for solving these problems. It's pretty complicated so I doubt that I will ever do it all. I'm posting it here in order to get some feedback from people who might have a lot more knowledge about the radio side of things.

Here's the idea in simplified form:

Each station (the car and one or more hang gliders) has the following major components:

1) 2-meter FM transceiver (the ones we have now).
2) Long wavelength (10-meter?) CW transceiver.
3) GPS receiver.
4) Flat-panel display of reasonable size (4x4?).
5) A control module which runs the display, interfaces a speaker and mike, and encodes/decodes a digital signal to/from the transceiver.
6) Mongo battery to power everything (solar cells on the glider?).

Via some packet protocol, all gliders and the car keep each other updated with their current positions. In operation, the display is used primarily as a moving map. The positions of the hang glider(s) and the chase car are constantly updated on the map. As the glider/car moves, new maps are drawn as needed.

When the 2-meter voice communication breaks down due to excessive distance or obstacles, the operator would switch to sending voice communications via

the digital link. The control module would digitize a voice message, compress it, and send it out in packet form.

To my mind, using this system for voice has the following advantages:

1) The long wavelength will penetrate obstacles and refract around hills better than 2-meter. This will allow for longer distances with a given amount of power.
2) Using CW modulation for packet communications will use power more efficiently than an FM rig.
3) By converting the voice message to digital form, the use of error checking and correction codes is possible.
4) At a given power level, one could achieve greater transmission distances by lowering the baud rate.
5) Fits in well when another digital data stream (gps coordinates) must be sent as well.

Possible problems that might arise with my scheme:
1) Legal problem with non-approved encoding on a HAM band.
2) A frequency that's clear at the starting point may interfere with another HAM operator as the gliders/car travels into a new area.
3) The size of a good 10-meter antenna may be too large for a hang glider (or car for that matter).

Anybody out there have some ideas on improving this scheme? Are there other fundamental problems that I've missed?

Thanks for your attention,

Kevin Cameron

> --GaryM

Gary, you have four choices:
1. Kantronics D4-10, 10 watt for 9k6 and 19k2 - $350
2. TEKK Model KS-900 or KS-960, 2 watt for 9k6 (*) - $120
3. Azden PCS-9600(?) 25-30 watt for 9k6 - $650
4. Modify a commercial rig - micors work well

If 2 watts will be enough, the TEKK is highly recommended. Tiny, no frills, crystal-controlled, and inexpensive. The KS-960 is the more expensive model, but you gain little for the money, and no performance increase. John WB3ESS developed a simple upgrade mod (a few capacitors here and there) to improve performance at 9k6, which really helps (if you need details, reply via mail).

If 2 watts won't fly, a modified commercial rig might be the next best bet. The other routes are basically plug-n-play, but costly.

3912. TM-742A

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-08-30 00:00:00 UTC
From: rick.edwards@mogur.com
Message-ID: <9508300930441004@mogur.com>
Source record: 41499

I have a new 742A. It is a great radio! I enjoy it very much.
However, I do have a couple of questions that I can't seem to find the
answer to in the manual. Maybe you can help me.

1) When using the autodialer, the button sequence is PTT, PF, & then the
autodialer memory number (#1 in my case). The transmitter turns on when
the PTT is pressed, of course, but then turns off when the PF button is
pressed and then back on for the DTMF string. However, there is no (or
very little) pause between the transmitter turn on and the sending out
of DTMF. I use two repeater autopatches and neither of them likes this
and it _usually_ results in a misdial. Question: Is there anyway to
add a pause or a brief wait between the transmitter turning back on and
the output of DTMF?

2) When using the 742A in a crossband repeat mode between a 220
repeater and my 2m HT, I have to wait for the 220 repeater to drop
before I can transmit. This becomes a real drag when on a roundtable
on the 220 repeater and it has a long hang time. Is there anyway
around this? Is there a way to make the 742A act like a single
frequency repeater on the 2m side (ie. sample the receive every few
hundred milliseconds)?

Thanks....<re>

I would buy an SCC card for high speed (19K2 and up) and an external
TNC for 19K2 and down. Alternative is the PacComm Spirit TNC which
is a modern design that can go very high in speed.

Linux has code for the PI2 SCC card, so it would be folly to get anything
else.

Leave the Baycom for the DOS boys, forget about it for real operating
systems.

Sorry I cannot help you on your first problem problem which was
the fact that your 742A drops carrier when you press PF in order to
access an autodial memory. This must be some sort of Kenwood mic
problem because my Tm733A does the same thing. I called Kenwood
on this and they acknowledged this behavior is what is designed.
I asked why and the tech could not explain why the radiois designed
this way. He basically told me I was out of luck and I should tell
my repeater owner to change the timing of the repeater.

Okay I guess I will cooly put my 50 dollar 1200 baud modem in a bag, Yes
that is pathetic. 50 dollars for a 1200 baud modem, when will amateurs learn...
And hit it repeatadly with a hammer until a fine powder is left.

It was relayed to me that the apollo missions was handled soley by
punched card and the equivalent of a commodore 64. I'm not going to be
crunching gaussian field equasions in the background or anything like
that. I'm just at the end of my rope and considering hand grenades as an
alternative. For some reason packet just doesn't like me. And now I am
considering things like satelite communications when I can't even get
something simple like a 1200baud half duplex modem to work. Why wasn't I
smart and chosen a nice hobby like paintball instead.

: Why not just have the chase crew put a repeater in the car?

The way you ask that question leads me to believe that I
didn't make myself clear. The chase crew rides in the car
chasing the hang glider pilot.

So, a repeater on the car wouldn't help. Also, repeaters are
scarce in the remote areas where such flights usually take place.
While car-to-hg transmissions could be helped by installing a
high powered radio, this option doesn't work out well on the
hang glider since battery energy is limited.

I guess a large antenna on the car is possible but there are
limits there. Perhaps a directional antenna would be possible
to gain a few db. This would add to the workload of the chase
crew though.

But what about the basic idea of using a long wavelength and
cw modulation to get extended range? Am I all wet? How much
range improvement could I expect for a given amount of power?

Allan,

Call ICOM America at 206-454-7619, press " 3 " when the automated system answers. You will then be connected with ICOM's parts dept. They have a manual titles the " CI-V Reference manual " for sale at a cost of about $15.00 plus shipping. This manual has the commands for the IC-R7100. Newer ICOM radios now have the command set for the radio right in the operators manual so it is doubtful the CI-V Reference Manual will ever be updated

Hello..I was wondering if there are any thing i would have to go through
to put a FBB packet BBS online in my area..for use as a carbon
server..anyone running a packet BBS or has experience, could you please
help me!

Many Thanks

Jim - KD6HWC

Seems you have two separate issues: Loss of Line of sight (LOS)
propogation from the Hang Glider (HG) to chase vehicle (Problem #1)
and some means of reporting accurate locations of both.(Problem #2)

Problem 2 might be solved by the Bob Bruniga APRS packet locating
system that takes GPS receiver data and automatically inserts it into
TNC packet header data . There have been QST articles on it for
emergency service use. The position of all packet stations heard is
automatically displayed and updated realtime on screen maps in VGA
display. This should help in the chase and HG locations IF THEY CAN
HEAR EACH OTHER (see problem #1). I have only examined the program
not used it since I do not have a GPS receiver. The filename is
APRS403.ZIP and I think I got it from Compuserve or one of the Packet
Radio Homepages.

>Another problem is determining the positions of both the glider and

>as needed.

(My understanding APRS will do exactly this)

>When the 2-meter voice communication breaks down due to excessive distance
>or obstacles, the operator would switch to sending voice communications via

You still have to have an RF path for this to work - regardless of the
frequency used.

> 1) The long wavelength will penetrate obstacles and refract
> around hills better than 2-meter. This will allow for
> longer distances with a given amount of power.
I suspect only marginal improvement with tradeoff of greatly increased
antenna size and possibility of band opening interference at 28 Mhz.
> 2) Using CW modulation for packet communications will use power
> more efficiently than an FM rig.
True but at a terrible overhead in operator skills and distractions
not to mention lower thruput
> 3) By converting the voice message to digital form, the use of
> error checking and correction codes is possible.
> 4) At a given power level, one could achieve greater transmission
> distances by lowering the baud rate.
> 5) Fits in well when another digital data stream (gps coordinates)
> must be sent as well.
Possible suggestions:

If this is a world class attempt, why not have a parallel powered
flight carrying a 2m rig and simple TNCdigipeater orbiting above the
HG flight area ? Their sole job is keeping the APRS datastream going.
If you run everything on 2m simplex you will have minimal interference
with other 2m operations.

Good luck - - it sounds like fun..

From: "Aaron Hartzler"
Message-ID: <424v9r$abp@usafa2.usafa.af.mil>
Source record: 41510

PacComm makes a PicoPacket/GPS, which is a GPS reciever and a TNC in a 2
X 2.5 X 3.25 inch package (so the add claims). It runs for about $625.
Add a transmitter and you are set.

Aaron

I would buy an SCC card for high speed (19K2 and up) and an external
TNC for 19K2 and down. Alternative is the PacComm Spirit TNC which
is a modern design that can go very high in speed.

Linux has code for the PI2 SCC card, so it would be folly to get anything
else.

Leave the Baycom for the DOS boys, forget about it for real operating
systems.

Subject: Looking for MA87127 Gunnplexers

Hi!

I am currently designing a 10 megabits/second digital data link for my final year Electronic Engineering project (I am a student at the University of Stellenbosch).

I am envisaging the use of Gunn transceivers to accomplish this, and my choice has fallen on the MA87127 or MA87125 from Microwave Associates. The data sheets for these indicate that they are "low cost", however I have not been able to obtain them locally at a reasonable price and within a couple of weeks (I am rather pressed for time).

If anyone knows how to get hold of these quickly or has a couple of used ones lying around (and you are willing to sell them), please let me know.

Thanks

From: rmjackso@intersource.com (Freddie Freeloader)
Subject: Looking for Mfr of fire/explosion detectors that transmit by radio

Scenario:
A business currently has in place approximatley 350 fire dectector stations that transmit on a frequency back to a central location. They are old (tubes are still used!). They have self diagnostics and transmit two (2) seperate type codes/frequencies. One is in the event of fire another is a noticification of an abnormality (i.e. broken wire/failed self-diagnostics). They transmit an identifier also so the location is known. This transmission in turn lights up a red light for a fire or a yellow light for a diagnostic problem.

Is anyone aware of a company that sales this type of equipment?
Are books available on the design of this type system?
etc...etc..etc...

What questions am I not asking that's needed to be known? (outside of frequency)

Thanks in advance.

> this off?

Have him set "ILfpack ON" which should be the factory default. This tells the PK-12 to ignore all Incoming Line feeds. Or he can set his terminal program NOT to add LF after CR.

> I've never seen the thing, but I get the impression that it isn't even
> remotely TAPR compatible (like my own KPC).

Command set is close. I peeked inside a PK-12 once and it is not even remotely similar to a TNC-2, neither is the KPC. In fact I almost bought a PK-12 just because the PK-12 uses a Motorola 68HC11 rather than the Zilog Z80 in the TNC-2. I do a lot of 68HC11 work, have an excellent C compiler

and Nohau emulator. Decided I didn't have was the time to make neat things
out of PK-12's.

> --GaryM

Gary, you have four choices:
1. Kantronics D4-10, 10 watt for 9k6 and 19k2 - $350
2. TEKK Model KS-900 or KS-960, 2 watt for 9k6 (*) - $120
3. Azden PCS-9600(?) 25-30 watt for 9k6 - $650
4. Modify a commercial rig - micors work well

If 2 watts will be enough, the TEKK is highly recommended. Tiny, no frills, crystal-controlled, and inexpensive. The KS-960 is the more expensive model, but you gain little for the money, and no performance increase. John WB3ESS developed a simple upgrade mod (a few capacitors here and there) to improve performance at 9k6, which really helps (if you need details, reply via mail).

If 2 watts won't fly, a modified commercial rig might be the next best bet. The other routes are basically plug-n-play, but costly.

Subject: What good stuff is there at 9600?

Well, I made the jump to 9600 baud - bought a new 2m rig with 50 watts out, put up a better antenna, put in a KPC 9612. Now what? I've been hearing about how great 9600 baud is for the last year, so I made the move to 9600. Now the only thing I find is the same BBS's at a faster data rate - hardly enough to cause me to jump for joy. Isn't there anything more interesting going on out there at 9600?

I get the general feeling from reading messages that moving to tcp/ip is alot better. Before I go to all that trouble, I'd like to hear some examples of what there is out there. Is anyone doing anything truly interesting at 9600? I'm interested in hearing comments. I'm sure that there must be something that I'm missing or not aware of...I just haven't found it yet.

It's not any better. When people talk about TCP/IP they are usually
talking about JNOS. What that means is putting up a BBS more than having
a TCP/IP client/server/router. If you could convince others to join you
and develop not only an email or chat thingy, but also to route packets
using TCP/IP, you may find the energy spent useful. In most cases you will
find that people are using JNOS IP packets over Rose or Netrom, and sucking
down BBS data to fill out the hard drive.

It may be a bit early yet. I think maybe in 10 years we should be ready for
everyone to have a Linux capability. I run Linux at home, I also use the
Alan Cox AX.25 kernel stuff (but I'd like to get rid of AX.25 totally and will).

If you want my opinion; I would recommend you get a Linux on the air. It's
real TCP/IP as opposed to xxxNOS BBS with incidental TCP/IP. It's full of
challenges, and can actually do real work (a software emporium of good stuff).
I think 3 or 4 users in town running 9K6 Linux connected boxes will have more
fun than all the 1K2 slack-jaws in the Universe.

I'm not sure if your approach is practical for a couple of reasons.

First, the distance increase caused by going to 10 meters as opposed to
2 meters will probably be only marginal. While HF generally has better
ground wave coverage than VHF, 10 meters is high enough in frequency that
ground wave coverage will be minimal. You might have better luck going
with 80 or 40 meters (or even 160?).

Of course, this raises problems with antennas, especially for the
ground mobile station. While shortened antennas do exist for mobile
stations, their efficiency is low. However, given the enhanced propagation,
this may still result in better signals than 10 meters. The antenna for the
glider shouldn't be too much of a problem since it should be possible to

use a trailing wire type of antenna (This may cause some concern when landing, though. It might need to be detachable, or retractable. Don't drag it into a high voltage power line on landing!).

Another problem is that packet on HF, due to bandwidth restrictions, is 300 baud. Given the bandwidth required for speech, and even with a fairly agressive compression algorithm, it may take several minutes to transmit only a few seconds of digitized speech, under nearly ideal conditions. Factor in some noise, signal fades, and other propagation problems, requiring retries and/or lost packets, and you may find that the throughput for digitized speech drops to nearly zero. (I've had packet (keyboard to keyboard) contacts on HF (primarily 40, but also 20 and 10 meters), and the throughput, even for simple statements is incredibly poor. I've had contacts where it's taken multiple minutes for 'Hi. Name is Joe' text to arrive! And I shudder to think of the time it would require for several thousand bytes of digitized speech).

As for the power requirements, I would guess that the digitized, packetized speech approach, even using a version of CW rather than AFSK, would still be an order of magnitude (or more) worse in power consumption due to the increased transmission time required of the 300 baud signal.

Now that I've thrown cold water over your ideas, let me toss out some ideas so that someone else can drench them with cold water. (And please don't take my critisms personally. I think what you proposed would work. It's just that I think there are more optimal approaches which may result in better throughput, higher reliability, and less weight).

I would envision a sytem based on APRS (Automatic Packet Reporting System). The system would be composed of: GPS transponders, palm-top computers running APRS software, TNCs, and radios (2-meter or HF). The idea of APRS is that that the computer reads the GPS system and transmits the data through the TNC/radio. Other APRS systems receive this data. As part of the APRS program, the received data is automatically plotted on the screen on a map, thus freeing the operators from having to interpret the GPS data and manually plotting it. The resolution of the map can be changed, under user control (map scales can vary from the entire world, down to city streets). Thus, the automobile driver, as well as the glider pilot, has both his position and the other person's position plotted on the map, which may also show highways, and other geographical features (rivers, etc.).

Additionally, short messages (one line or so) may be typed in and sent, in real time, to remote sites.

And (here's the neat part), certain APRS stations automatically digipeat received APRS packets. Thus, while the ground coverage of the automobile station will be limited for VHF operation, and the ground coverage of the glider station will be limited after it lands (although it should have quite good coverage while it's in the air, since the primary consideration for distance is height), if there is another APRS station in the vicinity (e.g., a base station with a high antenna), that station can digipeat the APRS transmissions from the others, resulting in a very wide area

of coverage (50-100 miles for 2 meters).

While this system does not provide voice coverage, it does provide the ability to communicate data via keyboard entry (This may be a bit impractical for long messages for the glider pilot while in the air, though). Given a small, micro powered TNC, a self-powered palm-top, a minature GPS, and a suitable VHF hand-held radio, the system should require a minimum amount of space and weight, while producing reliable communications over a fairly wide area.

Ok, I've got my raincoat on. You can turn on the cold water now.

Dave

3929. Decoding Non - Voice Pager Messages

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-09-01 00:00:00 UTC
From: 7z1is@sahara.com
Message-ID: <292.4191.27.0N35E066@sahara.com>
Source record: 41516

Hello and thanks 4 reading this message..
In POPULAR COMMUNICATIONS AUG 1995 edition magazine Tom Kneitel K2AES
wrote an article about decoding non voice pager messages.
saying that..
I learned that the digital paging signals i hear on my scanner are often
a
sequential mix combining several differentpaging transmission modse or
formats.
Tho most commonly encountered digital paging modesare known as
GOLAY,POCSAG
and super POCSAG. Super POCSAG is simply a sped-up method sending
POCSAG.
Whereas POCSAG operate at rate of 512 bit per second ,Super
POCSAG,transmit at
1200 bps. Intermixed with these signals there may also be DTMF and
other
sequential tones.....
As it turns out there's a commercially available decoder that reads out
digital
pager messages,the Universal M-400 Decoder.This self contained unit is a
boon
to the serious eavesdropper. It can decode GOLAY,POCSAG, and Super
POCSAG
digital paging modes.
The unit also decodes VHF aero ACARS messages,DTMF frequencies,plus CTCS
and DCS
codes. Although this report isn't concerned with the other things the
Universal
M-400 can do, ... End
now can u help me and explain whats GOLAY,POCSAG and Super POCSAG ...???
and is there any possibility to add any chip or any thing to our normal
TNC's to
decode the pager messages...??
Best 73,s de Ibrahim.

I've been experimenting with GPS, TNC, and 2 meter radios
in sailplanes since last May. APRS software on the ground provides
plots of the sailplanes on a map. It can also plot the positon of your car
on the same map (although I haven't used it).

I suggest you start with that, and then expand. It can get you on the air
quickly.

With a base station using a low-noise preamp and 30 ft. antenna, reliable
tracking out to 100 miles is achieved with the sailplane at 8000 ft altitude.

I planned to use a second sailplane as a relay for the first, but the
good results to date have put that on the back burner.

In southern Az there are a few 9000 ft mountains that can provide digipeater
coverage for this part of the state. That is how we are planning to go. In
some parts of the US, APRS wide area digipeaters may already be installed.

Most of us carry Cellular phones for land outs, but they don't cover far
desert places. Ham 2-meter voice repeaters on mountaintops have better
coverage for emergency purposes, but are not as convenient as cell phones.

An HP palmtop computer will barely fit in a sailplane.
We are not yet using this to display other sailplane positions (although
this should be straightforward). Operating a stand-alone beacon package
in the sailplane while flying doesn't add to the pilot workload. A map
display in the sailplane is technically possible, but the added pilot workload
and interconnect complexity must be justified by the benefits.

I'm not sure how this experience translates into hang gliders.

If you want more info or have questions, drop me an E-mail.

Mike Parker, KT7D
Ventus Sailplane, IC

Standard 1200 baud packet is done using Bell 202 tones; 1200/2200.
There is also a 1200 baud PSK format used on some satellites, but
I doubt this is interesting.

The antenna is the problem. 80M would be ideal, but can you live with trailing all that wire? Hmmm maybe if it's 28ga.

Are you familiar with APRS?
I'd think a better way would be a GPS reciever on a KPC-3 and a 2M handheld. Set it up to beacon position into APRS WIDE digis in the area and use a laptop in the mobile to track it. SOME of the UI packets would make it out.
What does the local APRS net look like?

Come to think of it, how about HF APRS using a 30M QRP rig? The antenna would be a little easier to manage than on 80, and the skywave would let you get a signal out under most conditions regardless of the terrain.

I didn't have any problems using Baycom with a Toshiba T1000SE. Admittedly,
it did have a 9.54 MHz 8086. You should be OK, I think.

So basically what you are saying that my Baycom is about as useful as a stump? I'm going to cooly put my 50, YES 50 DOLLAR 1200 baud modem!@$# in a paper bag, and hit it with a big hammer. I don't understand why a 1200 baud half duplex modem would ever cost more than 15 bucks. But thats amateur radio, people pay 100+ dollars for a friggin dipole. I guess I was stupid enough to spend 50 on a piece of crap like this. Anyways.

I can get a 57600 grapes kit? Then what see the masses of people connect at 1200 baud anyway? Someone told me that the saturn V project was run off of a computer less than that of a commodore 64 and punched tape. Now I'll be damned if a pentium can't keep up with 1200baud modem.

Now I've really said more than I wanted to. But when you buy something then everyone in the world rags on it. You feel like grabbing a duffle bag full of rifles and running out and shooting people from some rooftop. I'm tired of the nerdy and techie pros and cons. I really don't care anymore. I shoulda listened to instinct and stuck to paintball instead.

Jake

NOTES OF INTEREST:

LORD HOWE Is. VK9. Eddie, W6/G0AZT with W6OTC, N4TQO, and KE6FV will be active from Sept. 19th till Sept. 26th. They plan to be active with three stations on RTTY, CW, SBB and to take part on the CQ/DJ WW RTTY Contest. Calls will be VK9LZ on RTTY, VK9LX on CW and VK9NM on SSB. QSL all calls to Eddie Schneider, PO Box 5194, Richmond CA 94805.

ANTIGUA, V2. Stephen, WF2S, will be operating as V26Z from Sept. 17th to 30th with his partecipation also in the CQ/DJ WW RTTY test. QSL via homecall.

CAYMAN Is. ZF. JA6VZB and JH6RTO will be active as ZF2TY/8 and ZF2SF/8 from the Little Cayman. Operation from Sept. 24 to 28th on 160 to 10 meter usinf CW, SSB, RTTY and SSTV. QSL ZF2TY via JA6BSM and ZF2SF via JH6RTO.

The VK2SG RTTY DX NOTES are also available on Internet via Telnet or FTP at ab6z.ampr.org, at reflectors dx@ve7tcp.ampr.org, and digital-dx@st.rim.or.jp. See also the OH2BUA WebCluster at URL http://www.clinet.fi/~jukka/webcluster.html

BACK BULLETINS. Anyone wishing back bulletins from June 24th, 1994 to present, just send msg to W5KSI @ W5KSI.#NOLA.LA.USA.NA. For older bulletins of 1990-1991 is possible to obtain a copy from I5FLN, from 1992 up to now are computerized and you can address request to I5FLN @ I5FLN.ITOS.ITA.EU. On all request specify the year and (RTDX????) month/day.

For next week's bulletin send your bandpass to Bob, WB2CJL @ W5KSI.#NOLA.LA.USA.NA.

3942. Baycom on an XT?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-09-01 00:00:00 UTC
From: greg@core.rose.hp.com
Message-ID: <DE8nH6.97L@icon.rose.hp.com>
Source record: 41529

Just a sanity check....

I'm considering building a Baycom packet interface, and was hoping to run it
on an XT-class laptop (Data General / One). The DG/1 appears to be something
in the neighborhood of a 4-5mhz 8088.

Does anybody know if this machine will be able to keep up with 1200 baud packet?
I'd rather not build the interface if it won't work...

Thanks,

Greg KO6TH

email please; this group will expire before the weekend does.

>has a QWERTY keyboard plus an RS-232 interface. Intended use
>is to communicate with a TNC.

Some sharp handheld devices have rs232. The output is ttl level 0-5volts.
You can
(A) use a max232 to bump it to -12 +12
(B) jumper your tnc for 5volt ttl levels.

I have the Sharp 6300. It might be called something else in the U.S. of A.

My sharp has vt100 term emulation.

3946. KAM Mod?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-09-01 00:00:00 UTC
From: Barry Martz <ki8w@grfn.org>
Message-ID: <427rm9$287@newsserv.grfn.org>
Source record: 41533

Hi. I have a Kantronics Kam. OLD VERSION. I thought I saw an article in CQ Mag a year or so ago about changing the 300 baud hf port into another 1200 baud port by jumpering from the 1200 baud port. Was there such an article? I can't seem to find it. I suppose I could pull out the KAM book and look at pin outs but that would be to easy.

Thanks de Barry/KI8W

RB>--
RB>#include <std.dsclmr> root@lenin.svl.trw.com

RB>---
RB> * Origin: Usenet:TRW ASG (1:2619/599)

What you are talking about is the registered trademark of
Motorola, known as Continuous Tone Coded Squelch System(CTCSS)
Just a way of letting only certain signals into a radio, with out the
proper tone,a transiever set up for this will not open the squelch for
any hearing. It is just basically using a tone lower than the human ear
can hear but transmitted over the radio when the mike is keyed.
Variations are also called tone burst(1/100 second of tone) and
digital private line, which is a digital signal burst to open the
squelch of a repeater and other mobiles. All the major manufactures use
a type of system to limit access to the radio, but are listed in their
own company tradmark but still operate basically the same way.

3948. DJ580T mod question

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-09-02 00:00:00 UTC
From: travisp@ix.netcom.com
Message-ID: <428df5$f7r@ixnews5.ix.netcom.com>
Source record: 41535
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment

I am atempting to do the extended receive mod. on my DJ580T. I know
that you are supposed to cut the red wire, but I want to make sure
which wire you cut. With the unit's display facing up and the bottom
removed you can see a "red" loop wire that is about the same size as
the blue one, and then there is a small "orange/red" wire at the top.
I believe I cut the larger loop which is red and not the smaller loop
that is orange/red. If anyone can clear this up for me I would greatly
appreciate it. Thanks and 73.

3953. BayCom WWW page is back!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-09-02 00:00:00 UTC
From: ulrich@tcode.auckland.ac.nz
Message-ID: <428lgu$kgt@net.auckland.ac.nz>
Source record: 41540

Hi everybody,

I am pleased to report that the BayCom WW page has returned to the internet, following an interruption of over a month. The BayCom team member in charge of all internet activities, Fritz DF2RF, passed away suddenly on July 22nd. A colleague of his has now offered to take over, and Johannes DG3RBU informed me that the site has now returned. I have just checked it:

http://www.baycom.de

It contains a lot of information on BayCom and amateur radio in Germany. There are also contributions from BayCom partners in other parts of the world (such as New Zealand).

According to Johannes, new information will be uploaded soon.

Thanks to those who offered to host the page after Fritz's sudden death - it was a great show of ham spirit. Johannes believes that the current arrangement is the best given the circumstances.

3954. Re: AX.25 for Linux?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-09-02 00:00:00 UTC
From: todd@tj.org
Message-ID: <4298lo$3dr@news.scruz.net>
Source record: 41541

Mat Maessen, N2NJZ (maessm@magritte.its.rpi.edu) writes:

> I'm in the process of putting together a Linux machine...Does
> anyone out there know where I can find AX.25 kernel extensions,
> utilities, etc.

You'll find the more current versions in an "incoming" directory somewhere in the "ftp://ftp.ucsd.edu/hamradio/packet/tcpip/linux" hierarchy. I *think* it's under ".../tcpip", but I don't recall for sure, and I can't seem to reach the site at the moment to veify this.

WARNING: do *NOT* waste your time trying to get the version 28b release to build; the patch to "slip.c" calls ax25_send_frame() with three parameters when it takes four. I spent a couple of hours trying to figure out what I'd done wrong before finally concluding that it's a bum distribution.

I haven't gotten everything put together myself yet, but "kernel-029.tar.gz" builds without a hitch on the 1.2.13 kernel. It breaks some of the utilities from the old release (v25?) I'm currently using (v25?); I believe that "net-tools-1.1.95b" contains the current release of the utilities.

I remember seeing a notice that version 30.2 has been uploaded to "ftp.sunsite.edu", but since I can't find it there, I assume it's still cooling its heals in the "incoming" directory (which at SunSite is not readable.) It was also unclear to me from the release notes whether this version would build on a 1.2.x kernel, or whether it was intended solely for the adventurous souls running 1.3....

>systems.
>
>Steve

The Baycom software is excellent - makes multisession packet surfing clean
and easy. I got a PK96 for TCP/IP use, and the packet software for it
sucks.

Linux is great, but let's face it - there isn't much packet software
for Linux. Anybody care to write some?

3956. Linux Newbie questions

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-09-02 00:00:00 UTC
From: jlbarber@wolfenet.com
Message-ID: <4296fp$ivu@news1.wolfe.net>
Source record: 41643

Greetings, folks.
Although I'm a 15-year data processing veteran, I have *never*
before been close to a UNIX machine, and I'm getting ready to install
Linux for the first time ..

I know there are probably better groups to ask these questions, but
since I'm a ham, I thought I would start here. A quick rundown of
the hardware, then the questions. I would appreciate any help you
guys could give..

Hardware:
CPU: Intel P90, (PCI) 32mb RAM
DISK INTERFACE : Dual-channel IDE (LBA supported)
DISKS: (1) 1.2gb EIDE, (1) 420mb EIDE (on which I want to install Linux)
CDROM: "Acer" brand 4x IDE (on second channel)
VIDEO: ATI Graphics Ultra Pro Turbo (PCI, mach64 chipset) 2mb vidram
TAPE: Colorado 250 (QIC-80) on floppy controller
OTHER: 3.5" floppy, 2 serial, 1 parallel, SB AWE-32 sound card w/8mb
NODE frame grabber

Questions:

(1) I know that Linux has a ATI "mach32" X-server, (x_mach32). Will it
work with my mach64 card ?

(2) Does anyone know if my CD will work with one of the drivers ?
(say Sony?)

(3) I would like to put Linux on my 2nd drive. Since I have NT and
Win95 on the 1st, is there a way to do it without having to boot from
a floppy ?

(4) Is there a really good place for Linux dummies (like myself) to
ask endless lists of questions like these ? :)

Thanks in advance, guys.

73,
Jim Barber N7CXI
jlbarber@wolfenet.com

You know, I've found quite a few versions that are pure crap. I think people
don't really use it themselves when they modify the code. I spent a lot of
time getting a newer version compiled, only to find it didn't work. The data
came in on KISS and was lost somwhere in the stack. It transmitted just
fine, you could see the replies with "listen", but the frame was never
processed. Someones dicking over the code, and doesn't care if it works
or not.

Ham-Digital Digest Sat, 2 Sep 95 Volume 95 : Issue 270

Today's Topics:
AX.25 for Linux?

Baycom for Linux?
Baycom on an XT?
Baycom Software
Digitized voice/data via mobile packet radio
DJ580T mod question
Electronic Kits
Etch-A-Sketch
TM-742A

Send Replies or notes for publication to: <Ham-Digital@UCSD.Edu>
Send subscription requests to: <Ham-Digital-REQUEST@UCSD.Edu>
Problems you can't solve otherwise to brian@ucsd.edu.

Archives of past issues of the Ham-Digital Digest are available
(by FTP only) from ftp.UCSD.Edu in directory "mailarchives/ham-digital".

We trust that readers are intelligent enough to realize that all text
herein consists of personal comments and does not represent the official
policies or positions of any party. Your mileage may vary. So there.

Hi Mat

They are included as standard in the 1.3.XX versions of the vernl
code.

Okay I guess I will cooly put my 50 dollar 1200 baud modem in a bag, Yes
that is pathetic. 50 dollars for a 1200 baud modem, when will amateurs learn...
And hit it repeatadly with a hammer until a fine powder is left.

It was relayed to me that the apollo missions was handled soley by
punched card and the equivalent of a commodore 64. I'm not going to be
crunching gaussian field equasions in the background or anything like
that. I'm just at the end of my rope and considering hand grenades as an
alternative. For some reason packet just doesn't like me. And now I am
considering things like satelite communications when I can't even get
something simple like a 1200baud half duplex modem to work. Why wasn't I
smart and chosen a nice hobby like paintball instead.

rather not build the interface if it won't work...

I didn't have any problems using Baycom with a Toshiba T1000SE. Admittedly,
it did have a 9.54 MHz 8086. You should be OK, I think.

Subject: Digitized voice/data via mobile packet radio

PacComm makes a PicoPacket/GPS, which is a GPS reciever and a TNC in a 2
X 2.5 X 3.25 inch package (so the add claims). It runs for about $625.
Add a transmitter and you are set.

From: travisp@ix.netcom.com (Gerald Phillips)
Subject: DJ580T mod question

I am atempting to do the extended receive mod. on my DJ580T. I know
that you are supposed to cut the red wire, but I want to make sure
which wire you cut. With the unit's display facing up and the bottom
removed you can see a "red" loop wire that is about the same size as
the blue one, and then there is a small "orange/red" wire at the top.
I believe I cut the larger loop which is red and not the smaller loop
that is orange/red. If anyone can clear this up for me I would greatly
appreciate it. Thanks and 73.

From: rick.edwards@mogur.com (Rick Edwards)
Subject: TM-742A

I have a new 742A. It is a great radio! I enjoy it very much.
However, I do have a couple of questions that I can't seem to find the
answer to in the manual. Maybe you can help me.

1) When using the autodialer, the button sequence is PTT, PF, & then the
autodialer memory number (#1 in my case). The transmitter turns on when
the PTT is pressed, of course, but then turns off when the PF button is
pressed and then back on for the DTMF string. However, there is no (or
very little) pause between the transmitter turn on and the sending out
of DTMF. I use two repeater autopatches and neither of them likes this
and it _usually_ results in a misdial. Question: Is there anyway to
add a pause or a brief wait between the transmitter turning back on and
the output of DTMF?

2) When using the 742A in a crossband repeat mode between a 220
repeater and my 2m HT, I have to wait for the 220 repeater to drop
before I can transmit. This becomes a real drag when on a roundtable
on the 220 repeater and it has a long hang time. Is there anyway
around this? Is there a way to make the 742A act like a single
frequency repeater on the 2m side (ie. sample the receive every few
hundred milliseconds)?

Thanks....<re>

Sounds like you have an IRQ conflict. Check all your COM ports
and make sure each one has a unique IRQ. IE, not shared by any
other device.

Good luck...

I have an opportunity to buy an IBM -AT model 5170, 286 computer which I want to use on HF digital modes (amtor, pactor, Clover) using the HAL P38 board. Does anyone have any knowledge if this was a QUIET computer? I don't want to buy something that's going to be generating a lot of noise on HF. Any feedback is greatly appreciated!

Jim Barber (jlbarber@wolfenet.com) wrote:

: Hardware:
: CPU: Intel P90, (PCI) 32mb RAM
: DISK INTERFACE : Dual-channel IDE (LBA supported)
: DISKS: (1) 1.2gb EIDE, (1) 420mb EIDE (on which I want to install Linux)
: CDROM: "Acer" brand 4x IDE (on second channel)
: VIDEO: ATI Graphics Ultra Pro Turbo (PCI, mach64 chipset) 2mb vidram
: TAPE: Colorado 250 (QIC-80) on floppy controller
: OTHER: 3.5" floppy, 2 serial, 1 parallel, SB AWE-32 sound card w/8mb
: NODE frame grabber

Excellent hardware to run Linux on...

: Questions:

: (1) I know that Linux has a ATI "mach32" X-server, (x_mach32). Will it
: work with my mach64 card ?

The accelerated X servers works well on ATI unless you have the ISA
version of ISA graphic controller. I use mach64 server and like it
very much

: (2) Does anyone know if my CD will work with one of the drivers ?
: (say Sony?)
You will have to configure the CDROM as IDE drive. There are a lot
of HOWTO's in sunsite.unc.edu under /pub/Linux. I strongly recommend
that you read the applicable HOWTOs first before jumping into Linux.
Linux runs very well. It is very stable (definitely more than W95),
but it is just like ham radio. You will have to spend a lot of
time initially to experiment with it. There are books on Linux now
which can help you (The book "Linux Bible" is very good). When I
started Linux 2 yrs ago (v.99p15), there wasn't that much info on
it at all. It was a real challenge to get the "new toy" to work.

: (3) I would like to put Linux on my 2nd drive. Since I have NT and
: Win95 on the 1st, is there a way to do it without having to boot from
: a floppy ?
I boot mine using a floppy diskette. The time it takes a floppy diskette
to boot up is not that long. I also run NT and DOS. Each operating
system resides in a 512meg drive (2 IDE & 1 SCSI)

: (4) Is there a really good place for Linux dummies (like myself) to
: ask endless lists of questions like these ? :)

There is a comp.os.linux.xxxx newsgroup on the net. Just spend some
time reading the articles will help you a lot. If you have questions,

just drop me an email or a packet mail, I will try my best to help
you out.

I wish some people would sort out their mailing list software - bounces should never appear in the newsgroup and shouldn't bounce back to the original contributor either (I suffer from the latter problem occasionally). Set it up so that bounces either drop on the floor or at the very least inform the mailing list admin so they can remove the address from the list.

Source record: 41653
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment

I al building SUPER SMALL RADIOCONTROL ELECTRIC AIRPLANES (bellow 4 oz, with 3 proportional chanels). My latest airplane weight 3 oz 1/2, use 4 cells Ni-CD 110 mA, a FM 4 chanel proportional Receiver (6 grammes), 2 servos of 6 grammes (hand built in the USA), and a 3 grammes Electronic throttle (German)... all this is MUCH smaller then the CANNON RC System.

I am trying to built now a 2 oz Electric airplane, and for this I need even smaller RC systems, runing under less than 5 volts.

Do you know somebody manufacturing :

- SUPER SUPER small RC Systems (Using servos or actuators, but in all cases PROPORTIONAL)
- SUPER SMALL Electric DC motors with resonable efficiency under 1 or 2 Cells (1 to 2 volts !!). Some Micro COBALT ??

3967. Ham Radio Test Simulators - Mac

FREE - NEW Macintosh HAM TEST SIMULATORS

Studying for a ham test and have access to an Mac?

Upgrade Fast! Simulate the test and get S T I M U L A T E D!

Scores of 90% or > even get applause!

The new Macintosh Ham Test Simulators are HERE (and there if you can FTP)!

o Novice Ham Test 5.0 SA.sea
o Technician Ham Test 5.0 SA.sea
o General Ham Test 5.0 SA.sea
o Advanced Ham Test 5.1 SA.sea
o Extra Ham Test 5.0 SA.sea

The latest version "5" feature:

HyperCard 2.3 as a stand-alone application (SA) eliminating
your need to have HyperCard. All you need is a Mac with 4
Meg of memory and version System 7 or greater.

Each version "5" Ham Test Simulator has the latest questions
as prepared by the Question Pool Committee.

Each version "5" Ham Test Simulator is FREE OF CHARGE and work the
same way as the originals did (written by Diana, KC1SP).

You may obtain a version "5" Ham Test Simulator by mailing me a *FORMATTED
disk (1 per test) and include a Self Addressed and Stamped disk mailer for
the return.

Each version "5" Ham Test Simulator is also bundled with a shareware CW
program called MacMorse 1.4 written by Doug, WB0EON.

Also included in the version "5" collection are text files that relate an
interesting variety of ideas about the best way to study CW and prepare
for tests.

Or warm your phone line and get JUST the tests:

America On Line - Macintosh Ham Radio Section

or:

ftp://oak.oakland.edu//pub3/hamradio/mac/theory-and-morse/AdvancedHamTest.sea.bin
(Aug 30th)
ftp://oak.oakland.edu//pub3/hamradio/mac/theory-and-morse/ExtraHamTest.sea.bin
ftp://oak.oakland.edu//pub3/hamradio/mac/theory-and-morse/GeneralHamTest.sea.bin

ftp://oak.oakland.edu//pub3/hamradio/mac/theory-and-morse/NoviceHamTest.sea.bin
ftp://oak.oakland.edu//pub3/hamradio/mac/theory-and-morse/TechnicianHamTest.sea.bin

Your comments and suggestions for future versions are always welcome. Stay
in touch
and good luck with YOUR next test!

Subject: AX.25 for Linux?

Mat Maessen, N2NJZ (maessm@magritte.its.rpi.edu) writes:

> I'm in the process of putting together a Linux machine...Does
> anyone out there know where I can find AX.25 kernel extensions,
> utilities, etc.

You'll find the more current versions in an "incoming" directory somewhere
in the "ftp://ftp.ucsd.edu/hamradio/packet/tcpip/linux" hierarchy. I *think*
it's under ".../tcpip", but I don't recall for sure, and I can't seem to
reach the site at the moment to veify this.

WARNING: do *NOT* waste your time trying to get the version 28b release to
build; the patch to "slip.c" calls ax25_send_frame() with three parameters
when it takes four. I spent a couple of hours trying to figure out what I'd
done wrong before finally concluding that it's a bum distribution.

I haven't gotten everything put together myself yet, but "kernel-029.tar.gz"
builds without a hitch on the 1.2.13 kernel. It breaks some of the utilities
from the old release (v25?) I'm currently using (v25?); I believe that
"net-tools-1.1.95b" contains the current release of the utilities.

I remember seeing a notice that version 30.2 has been uploaded to
"ftp.sunsite.edu", but since I can't find it there, I assume it's still

cooling its heals in the "incoming" directory (which at SunSite is not
readable.) It was also unclear to me from the release notes whether this
version would build on a 1.2.x kernel, or whether it was intended solely
for the adventurous souls running 1.3....

The Baycom software is excellent - makes multisession packet surfing clean
and easy. I got a PK96 for TCP/IP use, and the packet software for it
sucks.

Linux is great, but let's face it - there isn't much packet software
for Linux. Anybody care to write some?

I'm not sure if your approach is practical for a couple of reasons.

First, the distance increase caused by going to 10 meters as opposed to 2 meters will probably be only marginal. While HF generally has better ground wave coverage than VHF, 10 meters is high enough in frequency that ground wave coverage will be minimal. You might have better luck going with 80 or 40 meters (or even 160?).

Of course, this raises problems with antennas, especially for the ground mobile station. While shortened antennas do exist for mobile stations, their efficiency is low. However, given the enhanced propagation, this may still result in better signals than 10 meters. The antenna for the glider shouldn't be too much of a problem since it should be possible to use a trailing wire type of antenna (This may cause some concern when landing, though. It might need to be detachable, or retractable. Don't drag it into a high voltage power line on landing!).

Another problem is that packet on HF, due to bandwidth restrictions, is 300 baud. Given the bandwidth required for speech, and even with a fairly agressive compression algorithm, it may take several minutes to transmit only a few seconds of digitized speech, under nearly ideal conditions. Factor in some noise, signal fades, and other propagation problems, requiring retries and/or lost packets, and you may find that the throughput for digitized speech drops to nearly zero. (I've had packet (keyboard to keyboard) contacts on HF (primarily 40, but also 20 and 10 meters), and the throughput, even for simple statements is incredibly poor. I've had contacts where it's taken multiple minutes for 'Hi. Name is Joe' text to arrive! And I shudder to think of the time it would require for several thousand bytes of digitized speech).

As for the power requirements, I would guess that the digitized, packetized speech approach, even using a version of CW rather than AFSK, would still be an order of magnitude (or more) worse in power consumption due to the increased transmission time required of the 300 baud signal.

Now that I've thrown cold water over your ideas, let me toss out some ideas so that someone else can drench them with cold water. (And please don't take my critisms personally. I think what you proposed would work. It's

just that I think there are more optimal approaches which may result in
better throughput, higher reliability, and less weight).

I would envision a sytem based on APRS (Automatic Packet Reporting System).
The system would be composed of: GPS transponders, palm-top computers running
APRS software, TNCs, and radios (2-meter or HF). The idea of APRS is that
that the computer reads the GPS system and transmits the data through
the TNC/radio. Other APRS systems receive this data. As part of the
APRS program, the received data is automatically plotted on the screen
on a map, thus freeing the operators from having to interpret the GPS
data and manually plotting it. The resolution of the map can be changed,
under user control (map scales can vary from the entire world, down to
city streets). Thus, the automobile driver, as well as the glider pilot,
has both his position and the other person's position plotted on the map,
which may also show highways, and other geographical features (rivers, etc.).

Additionally, short messages (one line or so) may be typed in and sent,
in real time, to remote sites.

And (here's the neat part), certain APRS stations automatically digipeat
received APRS packets. Thus, while the ground coverage of the automobile
station will be limited for VHF operation, and the ground coverage of the
glider station will be limited after it lands (although it should have
quite good coverage while it's in the air, since the primary consideration
for distance is height), if there is another APRS station in the vicinity
(e.g., a base station with a high antenna), that station can digipeat
the APRS transmissions from the others, resulting in a very wide area
of coverage (50-100 miles for 2 meters).

While this system does not provide voice coverage, it does provide
the ability to communicate data via keyboard entry (This may be a
bit impractical for long messages for the glider pilot while in the
air, though). Given a small, micro powered TNC, a self-powered palm-top,
a minature GPS, and a suitable VHF hand-held radio, the system should
require a minimum amount of space and weight, while producing reliable
communications over a fairly wide area.

Ok, I've got my raincoat on. You can turn on the cold water now.

Dave

The antenna is the problem. 80M would be ideal, but can you live with trailing all that wire? Hmmm maybe if it's 28ga.

Are you familiar with APRS?
I'd think a better way would be a GPS reciever on a KPC-3 and a 2M handheld. Set it up to beacon position into APRS WIDE digis in the area and use a laptop in the mobile to track it. SOME of the UI packets would make it out.
What does the local APRS net look like?

Come to think of it, how about HF APRS using a 30M QRP rig? The antenna would be a little easier to manage than on 80, and the skywave would let you get a signal out under most conditions regardless of the terrain.

Subject: Linux Newbie questions

Greetings, folks.
Although I'm a 15-year data processing veteran, I have *never*
before been close to a UNIX machine, and I'm getting ready to install
Linux for the first time ..

I know there are probably better groups to ask these questions, but
since I'm a ham, I thought I would start here. A quick rundown of
the hardware, then the questions. I would appreciate any help you
guys could give..

Hardware:
CPU: Intel P90, (PCI) 32mb RAM
DISK INTERFACE : Dual-channel IDE (LBA supported)
DISKS: (1) 1.2gb EIDE, (1) 420mb EIDE (on which I want to install Linux)
CDROM: "Acer" brand 4x IDE (on second channel)
VIDEO: ATI Graphics Ultra Pro Turbo (PCI, mach64 chipset) 2mb vidram
TAPE: Colorado 250 (QIC-80) on floppy controller
OTHER: 3.5" floppy, 2 serial, 1 parallel, SB AWE-32 sound card w/8mb
NODE frame grabber

Questions:

(1) I know that Linux has a ATI "mach32" X-server, (x_mach32). Will it
work with my mach64 card ?

(2) Does anyone know if my CD will work with one of the drivers ?
(say Sony?)

(3) I would like to put Linux on my 2nd drive. Since I have NT and
Win95 on the 1st, is there a way to do it without having to boot from
a floppy ?

(4) Is there a really good place for Linux dummies (like myself) to
ask endless lists of questions like these ? :)

Thanks in advance, guys.

73,
Jim Barber N7CXI

Hi Mat

They are included as standard in the 1.3.XX versions of the vernl
code.

Okay I guess I will cooly put my 50 dollar 1200 baud modem in a bag, Yes
that is pathetic. 50 dollars for a 1200 baud modem, when will amateurs learn...
And hit it repeatadly with a hammer until a fine powder is left.

It was relayed to me that the apollo missions was handled soley by
punched card and the equivalent of a commodore 64. I'm not going to be
crunching gaussian field equasions in the background or anything like
that. I'm just at the end of my rope and considering hand grenades as an
alternative. For some reason packet just doesn't like me. And now I am
considering things like satelite communications when I can't even get
something simple like a 1200baud half duplex modem to work. Why wasn't I
smart and chosen a nice hobby like paintball instead.

I didn't have any problems using Baycom with a Toshiba T1000SE. Admittedly,
it did have a 9.54 MHz 8086. You should be OK, I think.

Subject: Digitized voice/data via mobile packet radio

PacComm makes a PicoPacket/GPS, which is a GPS reciever and a TNC in a 2
X 2.5 X 3.25 inch package (so the add claims). It runs for about $625.
Add a transmitter and you are set.

Subject: DJ580T mod question

I am atempting to do the extended receive mod. on my DJ580T. I know
that you are supposed to cut the red wire, but I want to make sure
which wire you cut. With the unit's display facing up and the bottom
removed you can see a "red" loop wire that is about the same size as
the blue one, and then there is a small "orange/red" wire at the top.
I believe I cut the larger loop which is red and not the smaller loop
that is orange/red. If anyone can clear this up for me I would greatly
appreciate it. Thanks and 73.

Subject: TM-742A

I have a new 742A. It is a great radio! I enjoy it very much. However, I do have a couple of questions that I can't seem to find the answer to in the manual. Maybe you can help me.

1) When using the autodialer, the button sequence is PTT, PF, & then the autodialer memory number (#1 in my case). The transmitter turns on when the PTT is pressed, of course, but then turns off when the PF button is pressed and then back on for the DTMF string. However, there is no (or very little) pause between the transmitter turn on and the sending out of DTMF. I use two repeater autopatches and neither of them likes this and it _usually_ results in a misdial. Question: Is there anyway to add a pause or a brief wait between the transmitter turning back on and the output of DTMF?

2) When using the 742A in a crossband repeat mode between a 220 repeater and my 2m HT, I have to wait for the 220 repeater to drop before I can transmit. This becomes a real drag when on a roundtable on the 220 repeater and it has a long hang time. Is there anyway around this? Is there a way to make the 742A act like a single frequency repeater on the 2m side (ie. sample the receive every few hundred milliseconds)?

Thanks....<re>

I don't have specific answers to your questions, but you should consult the
HOW-TO docs for Linux and will find many of the answers. They can be found

at sunsite.unc.edu in /pub/Linux/docs/HOWTO. One of these is on hardware compatibility and there are others on cdroms, sound cards, etc. Also FAQs. I use a program called LOADLIN which runs from dos and installs boots the Linux kernel. Another program called LILO writes to the boot area of the hard drive and allows you to select which operating system you want.

Yes, there's a Mac64 X11R6 server
>
>(2) Does anyone know if my CD will work with one of the drivers ?
>(say Sony?)

Yes, but don't use the Sony or other CDROM drivers. Linux supports
IDE CDROMs directly. You may need to recompile the kernel to add
this support.

:
: You know, I've found quite a few versions that are pure crap. I think people
: don't really use it themselves when they modify the code. I spent a lot of
: time getting a newer version compiled, only to find it didn't work. The data
: came in on KISS and was lost somwhere in the stack. It transmitted just
: fine, you could see the replies with "listen", but the frame was never
: processed. Someones dicking over the code, and doesn't care if it works
: or not.

Where did you get the code from? I don't get it off of ftp.ucsd.edu
anymore because I found that someone usually puts those files together
themselves, which probably explains your problems. The AX.25 code and
the utilities are usually available from ftp.linux.org.uk in the
pub/Radio directory I think (ftp there, you'll see it). Plus the proper
files are usually uploaded to sites such as sunsite.unc.edu.

If somebody ftp's the code to ftp.ucsd.edu please ONLY upload the exact
sources that the authors release and do not change it or add anything
to it at all or re-tar and re-zip it.

Ron

As I understand it, the computer *IS* the modem, or at least the active
ingredient. It works by measuring the time between zero crossings or
something like that. No FIFO buffering here. We're talking about the
equivalent of pushing 57600 bps with vanilla 8250 chips.

Well, maybe they don't "have to", but some of us take pride in how long
we've had the same/perhaps original callsign. I've had mine since 1954.
I was just curious as to who might have had it before me. Kind of like IF
you are an orphan, who was your biological father.

Hi Travis, I sale a book by Artsci "Radio and Tech Mods and Alignments",
(discounted to $17.95) at my web ham store at
http://www.csz.com/sarrio.html. The book shows with diagrams how to expand
the DJ-580t's TX to 130-175 MHZ&410-470 MHz, also RX for Aircraft Band and
800 MHz. The book says cut hte Blue wire for expanded TX and the RED wire
For aircraft and 800 MHz The book doesn't mention an orange wire. Hope
this helps, 73's Ray

You know, I've found quite a few versions that are pure crap. I think people
don't really use it themselves when they modify the code. I spent a lot of
time getting a newer version compiled, only to find it didn't work. The data
came in on KISS and was lost somwhere in the stack. It transmitted just
fine, you could see the replies with "listen", but the frame was never
processed. Someones dicking over the code, and doesn't care if it works
or not.

So basically what you are saying that my Baycom is about as useful as a
stump? I'm going to cooly put my 50, YES 50 DOLLAR 1200 baud modem!@$# in
a paper bag, and hit it with a big hammer. I don't understand why a 1200
baud half duplex modem would ever cost more than 15 bucks. But thats
amateur radio, people pay 100+ dollars for a friggin dipole. I guess I
was stupid enough to spend 50 on a piece of crap like this. Anyways.

I can get a 57600 grapes kit? Then what see the masses of people connect
at 1200 baud anyway? Someone told me that the saturn V project was run
off of a computer less than that of a commodore 64 and punched tape. Now
I'll be damned if a pentium can't keep up with 1200baud modem.

Now I've really said more than I wanted to. But when you buy something then everyone in the world rags on it. You feel like grabbing a duffle bag full of rifles and running out and shooting people from some rooftop. I'm tired of the nerdy and techie pros and cons. I really don't care anymore. I shoulda listened to instinct and stuck to paintball instead.

Jake

From: kevinc@PROBLEM_WITH_INEWS_DOMAIN_FILE.UCSD.EDU (Kevin Cameron)
Subject: Digitized voice/data via mobile packet radio

Hi there,

I am a hang glider pilot who dreams of someday making a record distance flight. One of the problems on a flight like this is maintaining contact with ones chase crew. Often, the road that the chase crew must drive diverges quite a ways from the path that the pilot is flying. Also, at times the hang glider can outrun the chase car. The result is that the pilot and chase crew could find themselves separated by a large distance with intervening hills/mountains. The 2-meter radios that we carry are often inadequate. In order to maintain safety margins in remote areas, the pilot must sometimes slow down or choose less than optimal routes. Many a pilot has had to spend one or more nights in the desert after losing track of his chase crew.

Another problem is determining the positions of both the glider and car. While I am planning on having a GPS receiver on both, it is difficult to plot ones position on a map while driving a car and worse while flying a hang glider.

I've come up with a somewhat grandiose scheme for solving these problems. It's pretty complicated so I doubt that I will ever do it all. I'm posting it here in order to get some feedback from people who might have a lot more knowledge about the radio side of things.

Here's the idea in simplified form:

Each station (the car and one or more hang gliders) has the following major components:

1) 2-meter FM transceiver (the ones we have now).
2) Long wavelength (10-meter?) CW transceiver.
3) GPS receiver.
4) Flat-panel display of reasonable size (4x4?).

5) A control module which runs the display, interfaces a
speaker and mike, and encodes/decodes a digital signal
to/from the transceiver.
6) Mongo battery to power everything (solar cells on the
glider?).

Via some packet protocol, all gliders and the car keep each other updated with their current positions. In operation, the display is used primarily as a moving map. The positions of the hang glider(s) and the chase car are constantly updated on the map. As the glider/car moves, new maps are drawn as needed.

When the 2-meter voice communication breaks down due to excessive distance or obstacles, the operator would switch to sending voice communications via the digital link. The control module would digitize a voice message, compress it, and send it out in packet form.

To my mind, using this system for voice has the following advantages:

1) The long wavelength will penetrate obstacles and refract
around hills better than 2-meter. This will allow for
longer distances with a given amount of power.
2) Using CW modulation for packet communications will use power
more efficiently than an FM rig.
3) By converting the voice message to digital form, the use of
error checking and correction codes is possible.
4) At a given power level, one could achieve greater transmission
distances by lowering the baud rate.
5) Fits in well when another digital data stream (gps coordinates)
must be sent as well.

Possible problems that might arise with my scheme:
1) Legal problem with non-approved encoding on a HAM band.
2) A frequency that's clear at the starting point may interfere
with another HAM operator as the gliders/car travels into a
new area.
3) The size of a good 10-meter antenna may be too large for a hang
glider (or car for that matter).

Anybody out there have some ideas on improving this scheme? Are there other fundamental problems that I've missed?

Thanks for your attention,

Kevin Cameron

3983. Help: Trouble Loading KaWin

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-09-04 00:00:00 UTC
From: kn4aq@aol.com
Message-ID: <42f8gk$dbk@newsbf02.news.aol.com>
Source record: 41670

I'm having trouble getting KaWin to run on my system. Stan suggested a message here, as he's on vacation. Thanks in advance for any assistance.

I've downloaded (and already registered) KaWin 6.04. But when I try to start it (double-clicking it's file in File Manager, or thru the Run command in File Manager, my hard drive clicks a few times, and then the computer stalls. No KaWin windows or screens have appeared yet -- the File Manager window is still on-screen. I can get out of the stall with CTL+ALT+DEL, and windows reports that the "program has stopped responding..." (Same problem with 6.02 and 6.0.)

I have downloaded VBRUN300.DLL in my Windows\System directory (although I got some errors reported during the unzip, and it took several tries to get an unzip without errors reported -- maybe that file's bad?).

I'm running a 486 DX2/66 with 8 meg of ram, and Windows 3.1. I notice most KaWin documentation specifies 3.11, which I believe is Windows for Workgroups -- does KaWin work with Windows 3.1?

Any suggestions?

If you can, please reply to the following address, as I don't pick up mail from my AOL address that frequently...

3984. BPQ code: X1J or KISS?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-09-04 00:00:00 UTC
From: w6go@netcom.com
Message-ID: <w6goDEEA61.Et0@netcom.com>
Source record: 41671

After making G8BPQ code work to talk directly to an X1J network node stack, it now appears to me that this may be a better way to have the BPQ code in my PacketCluster node talk to external TNCs.

Presently, my node communicates with two external Tiny2 TNCs which run "polled BPQ KISS" proms. I run the link between the computer and the TNCs at 19200 bps. The Tiny2's have 9600 bps daughter boards in them. Some disadvantages are that BPQ only updates the KISS parameters on occasion and there is no way to put the TNCs in a 'calibrate' mode to check transmitter deviation.

If I were to put X1J eproms in the Tiny2 TNCs, and handle them as a "node stack" rather than polled KISS TNCs, I would have the expanded stats and control which is available in the X1J code. Further, I could add another computer to the "node stack", run BPQ in it and access both the Tiny2's and the PacketCluster node for tests and perhaps even other connects.

It seems like the advantages to changing from polled BPQ KISS to X1J are substantial. Further, it would offload the node computer somewhat, eliminating the polling and placing the AX.25 functions completely into the TNCs.

Am I missing something? Is there a reason NOT to make this change and abandon BPQ KISS completely? Your thoughts will be much appreciated.

3986. Terminal program for BPQ code

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-09-04 00:00:00 UTC
From: w6go@netcom.com
Message-ID: <w6goDEDCDH.G8z@netcom.com>
Source record: 41673

I posted a query here asking for help communicating with the RS-232 side of a NetRom (TheNet X1J) stack using BPQ code.

Thanks to G4BKI/W4, WD4KAV, AD8I, K1LT, G8DJU, G4DBN, VE3VSM, K6PBT, and also G8BPQ himself, I now have a satisfactory implementation of BPQ which can hook onto the RS232 port of an X1J node and work as a full-featured terminal. I believe it will also work fine with a multi-node X1J stack, but I have not tried it.

First you load BPQ, telling it to talk "NetRom" language out a COM port on the computer. You also define a "TNCPORT" in BPQ for terminal access. Then you load BPQHTNC2 which, like BPQ, is a TSR. It hooks the TNCPORT and makes it available for a terminal, with commands like a TNC2 TNC. Then, you run BPQTERM, written by G4YFE. It happens much faster than my description!

I have gathered all of the programs and files needed to implement this and I have posted it on my ftp site. FTP to ftp.netcom.com, log in as anonymous, cd to pub/w6/w6go and get the file go-bpqtr.zip (97761 bytes). I have also uploaded the file to DX-BBS (502 898-8864).

Please let me know if you find the information useful.

I presented a talk at the WIMU convention last month which covers the anatomy of a DX spot as it is sent to users from a PacketCluster node. Critical user parameters were also discussed. Copies of the talk are available (in printed form it is 8 pages long, occupying two sheets of 8.5x11 paper) for SASE to:

W6GO (WIMU talk)
POBox 700
Rio Linda, CA 95673

It is not copyrighted and may be reproduced or excerpted without permission.

The talk is posted on our nodes as nine bulletin files. I have placed goparms.zip (which contains all 9 files) on my ftp site and have uploaded goparms.zip to DX-BBS (502 898-8864). To obtain the file by ftp, FTP to ftp.netcom.com, log in as anonymous, cd to pub/w6/w6go and get the file.

Our users have found the data useful, I hope you and your users will agree. Feel free to make changes to suit your situation. There are many different approaches to AX.25 parameters, and the schools of thought do not agree. I think all will agree, however, that we need to manage the user parameters on a busy frequency!

Well, the networking will work normally, just add routes etc. Read NAG for details if you need them. The programs in the bin directory (you did get the user stuff?) are what you use to do ax25 connects. I.e, call n0hdw or listen, or whatever ...

Continuous Tone Coded Squelch System..... a Subaudible tone that when detected by an system with a CTCSS Decoder will open the mute on the receiving radio, otherwise the mute remains closes, rather anti-social in a public system such as ham radio but a must for commercial users.

: Only 1000? Sorta hard to sample 1200 bits/sec with only 1000 samples. This
: is the core of what is wrong with Baycom-style modems, they trade CPU time
: for reduced hardware and as a result have to be much closer to the
: hardware of your system. When the OS has other ideas about CPU
: utilization, Baycom breaks.
: --
Really ? I have tested the "pcsp" patch thats emulates a sound card
with the PC speaker in a Linux box. This soft has a much higher interrut
rate that the baycom modem needs and it runs without much CPU penalty on a
50 MHz 486. I think that the ax25.com packet driver for DOS can be
implemented into the Linux Kernel without problems. But i know nothing
about the kernel to write the code myself.

Hello..I just have a couple of questions....

1. About PkGold
I am interested in using/trying PkGold..so I would like any
feedback about the software.

2. Centeral California Nodes
Does anyone have a listing of any Centeral Calif nodes that they
either could send to me by e-mail or by mail??

Thanks in advance for any replies!!

In Southern California, on some of the better mountaintops, CTCSS is
virtually required to help keep "grunge" from keying the repeater.

It's also often used because it seems every single little group
absolutely must have their own repeater on the biggest hill they can
possibly find. Since there aren't enough frequencies to go around,
CTCSS will let you put repeaters _too close_ together with _some_
success (if you can call it that).

Hi!

I am building a high-speed digital communications system and need two MA87127 "Gunnplexer" Gunn transceivers. These are manufactured by Microwave Associates, but I am unable to contact them.

I have tried the number on the data sheets (617) 272-3000 in Massachusetts, but nobody answers. I have also tried faxing them, but nothing gets through...

If anybody has a current telephone number, fax number or EMAIL address I would be very grateful.

Not at all anti-social - while I appreciate that VK voice repeaters are
carrier access, ours are not. CTCSS is an ideal alternative to using
an initial access tone in that it is totally automatic and (usually)
inaudible to listeners. Using CTCSS on a repeater output is also
beneficial because, if set up properly, the CTCSS is only on when there
is a carrier present on the input so idents don't disturb all those
monitoring.

We still have a few sites available if anyone is interested in becoming a forwarding partner. We still need Australia, South America, Alaska, Hawaii, and more. The response to this project has been overwhelming. So, if you would like to get in on the ground floor of the Network, let me know.

The requirements are: You must run an AX25 Packet bbs. It must follow the FBB standard for import and export. You must be somewhat familiar with the process of all this, although I will send you a how to do it package upon request. You must be able to ftp or send and receive email attach in BinHex or MIME encoded format. You must be aware if you can receive large email attachments. Sometimes this really makes the provider mad.

We are also looking for additional ftp sites if anyone can offer such a thing at no charge. Please contact me via email with your proposals. Do NOT post here.

Current direct connections are: South Africa, Saudi Arabia, Italy, Sweden, Canada, The U.S. of course, Florida, Colorado, and more.

Oh, I am looking for someone in Minnesota. Minneapolis preferably. Please contact me if you are interested.

4009. AX.25 for 80C537 ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-09-05 00:00:00 UTC
From: Oliver Welp <welp@uni-muenster.de>
Message-ID: <42idne$1dh2@majestix.uni-muenster.de>
Source record: 41689

The Nienberge Amateur Radio Group (NW Germany) - ARTOB team
needs your help:

We are about to implement a single chip microprocessor to the payload of
our balloon to handle all the telemtry / remote control stuff.

The processor we use is a 80C537 which features two RS-232's. We want to use
them for telemetry output but -because of weight- won't add a hardware TNC. Our
choice is a TCM 3105 as it is used (e.g.) in the BAYCOM modem.

So a RTTY output would be rather easy, we would rather have a PR output
because of availability on ground stations. Unfortunately, our programming
capacity is limited (in fact mainly 1 OM is doing that).

So my question is:
Did anybody try that before on this or a similar processor (actually any 80.. would
do) and maybe could provide the code for the packet part? Or does anybody know
about a program already doing this and tell us where to get it?

Any help would be appreciated! Please tell us via PM.

Best 73, Oliver

4010. Help with configuring JNOS 1.10K

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-09-05 00:00:00 UTC
From: dql@netcom.com
Message-ID: <dqlDEGArv.JKp@netcom.com>
Source record: 41690

Hello,

I am trying to configure JNOS 1.10K to run on a 386 computer and a KAM+ for the past several days. I am able to get the software to run ax25 connection now. When I tried the tcp/ip services, I always get some kind of error right after typing the command. The only command which seems to work is the 'ip heard', which would list several ip that the program heard on the frequency (145.75 mhz in the Bay Area) The ping command just displays a message 'Resolving xx.xx.xx.xx' then just stops until I hit the Ctrl-C key. Telnetting into one of the addresses heard, i.e, telnet 44.4.10.16, always end up with an error 'Normal error: 19'. Am I doing something wrong? what is error 19? Any suggestions would be greatly appreciated since I am pretty much stuck on tcp/ip now. I have read several manuals (NOS Intro, Jnos, ka9q nos...), but none of them described any error codes at all.

I also try to put the address and callsign heard into the domain.txt file, but the result is the same.

The other question I have is the ax25 connection. How can I abort the connection in progress? It seems to me that there must be a way to abort the connection instead of waiting for the full timeout & retries... I tried 'close' and 'disconnect' without any success...

Thank you very much,

Danh Le, ke6dnd

> 'calibrate' mode to check transmitter deviation.

With the PacComm 9k6 modem, you only have to ket PTT, and the modem will send
out a scrambled tone which is fine for adjusting deviation.

> Further, I could add another computer to the "node stack", run BPQ
> in it and access both the Tiny2's and the PacketCluster node for

Yes, that is true - overall, the advantages (including stability) far outweigh
the disadvantages (none).
>
> Am I missing something? Is there a reason NOT to make this change
> and abandon BPQ KISS completely? Your thoughts will be much
> appreciated.
>
> 73, Jay
> w6go@netcom.com
One possibility you haven't considered is using a dedicated TNC in a 'dogbone'
configuration: One TNC is connected as a TNX1J into the diode matrix stack, and
another TNC runs regular ordinary TNC2 code. The two are tied together on
their radio ports, perhaps with a double-DIN cable. The DXCluster speaks to a
normal RS-232 port (the TNC2), which talks to a TN node as if it were a user.
For higher speeds than audio, just connect the modem disconnect headers
together with wires. To add more than one computer, just get another ordinary
TNC, connect the computer to it, and interface it with the dedicated TN TNC.
Of course, you can't make a 3-way connection at the modem disc. header, so you
need a nifty little circuit that was detailed in the latest NEDA Annual. A
company in NJ sells a kit of six of these little plug-in circuits (for joining
up to 6 TNCs via their modem headers) for $12.95 +$3 shipping. Contact Amateur
Networking Supply, PO Box 219, Montvale NJ 07645. Their FAX is 201-722-0144,
and internet is 73227.2644@compuserve.com
Good luck & 73,

From: scicon@ix.netcom.com
Message-ID: <42j3cc$mp5@ixnews3.ix.netcom.com>
Source record: 41449

I built the JVFAX interface according to the schematics that came with version 6.0.

I only built the power supply, AM section and the ADC section.

I can't seem to get the ADC section to work, but I know the AM section is working. Also, some of the ICs get real warm.

Has anybody else experimented with this?

I have a nasty feeling that you do not have any IP routes (or at least routes
to your intended victims) configured. The command:

route add default <name of port> e.g. route add default tnc0

should at least get you started in the direction of those on the same freq,
fingers crossed they have a route back to you !

> I have read several manuals (NOS Intro, Jnos, ka9q nos...), but none
> of them described any error codes at all.

One of the best docs is called "README.NOW" and is distributed with the
source code. It's heavy going for newcomers, but may become vital reading
as you master JNOS

<BEGIN EXTRACT>

ERRORS IN NOS:

Here is the long awaited list of error numbers used in nos!
The numbers listed are directly from the sources (socket.h),
and when appropriate, are followed by a little description I've
shaken out of my pen :-)

```
#define EMFILE 1 Too many open files (ie too few file handles)
#define EBADF 2 Bad file number (programming error)
#define EINVAL 3 Argument invalid
#define ESOCKTNOSUPPORT 4 Socket type not supported
#define EAFNOSUPPORT 5 Address family not supported
#define EOPNOTSUPP 6 Option not supported
#define EFAULT 7 Generic error (unknown)
#define ENOTCONN 8 No connection established
#define ECONNREFUSED 9 Already connected, or connection refused,
#define EAFNOSUPP 10 Address family not supported
#define EISCONN 11 Already connected
#define EWOULDBLOCK 12 Socket would have blocked
```

#define EINTR 13 Interrupted operation
#define EADDRINUSE 14 Address already in use
#define ENOMEM 15 Not enough system memory to do task
#define EMSGSIZE 16 Msg too big?
#define EALARM 17 Timer timed out
#define EABORT 18 Action aborted
#define ECONNNOROUTE 19 No tcp route to target address

Note: the AX.25 forwarding code may log error messages containing an error code returned by the Borland runtime or by MSDOS. These codes are found in the Borland errno.h include file.

<END EXTRACT>

> The other question I have is the ax25 connection. How can I abort the

> tried 'close' and 'disconnect' without any success...

reset <session no.> e.g. reset 2

Do try and get hold of a book called NOSINTRO by Ian Wade, the ARRL should be a source. It is by far the best book on NOS-taming, and I have never got my copy back .....

Cheers,

Gareth.

4016. AEA PK-232MBX & Yaesu FT-736R

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-09-06 00:00:00 UTC
From: kory@avatar.com
Message-ID: <42klmo$sjg@avatar.avatar.com>
Source record: 41453
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.digital.misc

I have a AEA PK232 TNC and a Yaesu FT-736R rig. The 736 has data in/out jack for TNCs. This method bypasses the FM modulaters pre-emphasis and de-emphasis circuits. Its suppose to be better, unless the TNC already compensates for this, in which case it would be worse. The Yaesu manual states that most TNC-2 clones already do the compensation and I believe the PK232 is a TNC-2 clone. I've been trying for two days now to call AEA and ask them this question, but the tech support lines are *constantly* busy.

The main reason that I want to hook up my TNC this way is that I don't have to plug/unplug the TNC and Mic and Speaker jacks. I know I can buy a switch box from MFJ, but then thats two more gadgets that I really don't need.

Thanks,
Kory

Hi!

A few friends and I wish to set up a simple, low speed message
network (digital) on 80m using straight CW transmitters.

Is there an established way of doing this?

How would I go about choosing a frequency?

Thanks,
Eric.

>by Fred R. Goldstein, K1IO. This protocol is a dirivative of the IEEE 802
>committee family of LAN networking protocols, 802.3, Ethernet, 802.4,
>Token Bus, and 802.5, Token Ring.

Well thanks for the credit, but please don't ascribe too much serious
intent to A802! I wrote it to make a few points. One, it's not
necessary to follow the baroque procedures of LAP-B, including its weird
coding; A802 used ASCII-mnemonic header fields so that a plain ASCII TTY
lurker could figure it out (in its async mode). Two, AX.25 has only four
things in common with ITU/CCITT X.25: X, dot, 2 and 5. A802 has about the
same amount in common with IEEE 802! The name was sort of a parody.
Nonetheless my paper did attempt to describe a theoretically-useful
protocol in terms less obscure than AX.25 or X.25, whose protocol specs,
in CCITT style, are written so that only those who already understand them can
read them.

In 1993, Phil Karn, KA9Q, the creator
>of NET/NOS TCP/IP software for ham radio, proposed a FEC/ARQ hybrid
>replacement for the link-layer. Hopefully we'll find something soon that
>can deal with noisy, busy channels and still get the data through.

Yes, wouldn't it be nice if amateurs led, rather than opposed, progress?

I was in Chicago a few years ago and found that some of the repeaters in the downtown used CTCSS, this in order to cope with killer levels of intermod. As part of the digitized voice ID they were giving the callsign and stating "using CTCSS tone <<frequency>>", ie: they were making it VERY clear to everyone what they were doing. Given the trade-offs I can understand what these hams were doing, and I think they were handling it in a reasonable manor (given that almost all all HTs come with, or can easily enough get a CTCSS generator).

In an ideal world intermod would not be a problem, but CTCSS is a reasonable solution to intermod. Now, I would get VERY annoyed if I ran across a repeater that did use CTCSS, and tried to keep the tone being used a secret.

The Yaesu manual is wrong, but the end result is correct. The mic plug
should be used with the PK-232 (which is *NOT* a TNC2 compatible!) at
1200 baud. The reason you WANT the pre-emphasis circuits of the radio to be
used has little to do with the TNC - it depends upon the receiving TNC's radio
connection: both ends should either use pre- & de-emphasis, or not. You
mustn't have one end using it and the other end not, that will cause problems.

Forget the MFJ box, build your own.

73,
Don N2IRZ

The PK-232 isn't even *close* to being a TNC-2 clone. It uses an
entirely different modem design. But it does still have tone twist
at 1200 baud. At least, unlike the TNC-2, the twist is in the
correct direction to compensate for the radio's emphasis/demphasis
circuits in the microphone amplifier. The MF10 in the TNC-2 is setup
to give exactly backward twist, no wonder people have problems. Ideally,
you want to supply flat twist to the modulator, but given all those other
people out there with backward twist, leaving the twist as is on the
PK-232 isn't a bad idea.

>The main reason that I want to hook up my TNC this way is that I don't

Unfortunately, most TNCs don't mute tx audio when they are idle, and
I believe the PK-232 is no exception in this regard. That means if
you try to use the mic while the TNC is powered, you'll get random
packet tones mixed with your speech. So power down the TNC before
trying to talk. Conversely, the 736 doesn't mute the mic when you
transmit tones from the TNC, so either be very very quiet, or unplug
the mic when doing packet. Seems you can't win in your quest to
avoid a switchbox or plugging and unplugging cables.

>intro to packet radio, what kind of equipment I can use, what
>frequencies...? (perhaps there is a FAQ that I can read) Thank you.

Boy, that could be the subject of several books, and in fact is.
Packet uses range from simple keyboard chatting to full blown
X Window client/server applications running between consenting
Unix boxes. Available speeds run from 300 baud at HF to 56 kb
at UHF. But most 2 meter operation pokes along at 1200 baud via
Bell 202 tones over FM voice grade radios. Since packet is typically
done on a shared channel, and half-duplex, don't try to compare
those baudrates to telco modem rates. Typical real world performance
will be 1/2 to 1/4 or less of the stated rate in terms of bps
throughput.

The simplest setup is a TNC and a voice grade FM radio, even a HT,
though a more powerful radio is preferred. This'll get you on
1200 baud. As noted above, effective throughput will actually
be on the order of a 300 baud telco modem, so don't expect to
be able to do much in the way of realtime interactive applications.
Email via BBS stations is the most popular use of 1200 baud packet.
Following that closely are PacketCluster DX spotting nets, and
following that is keyboard chatting. One very interesting application
which is gaining popularity is APRS, which is a position reporting
and mapping system that uses a TNC, GPS, and PC to track in near
realtime the location of various participating packet stations.
There are all sorts of uses for this, from foxhunting to balloon
chasing, to simply developing an accurate map of your area.

To get to the more interesting file transfer and interactive
applications, you need more speed. While there is some 9600
baud activity on 2 meters via accessory modems over voice
radios, this is not simple plug and play. Depending on the
radio you have, you may find this difficult to get going
properly as you may have to internally modify the radio.
There are a few 9600 ready radios at 70 cm which ease this
process somewhat, and one of them can also do 19.2 kb.
But for the higher speeds necessary for real networking,
you need a dedicated RF modem. The WA4DSY 56 kb RF modem
is the current champ in this area.

There is a caveat to speed and more speed, however, it does
you little good to have a fast modem if no one else in your
area has one. So before going above 1200 baud, which is built
into all TNCs, consult with local amateurs to see if they
are using higher speeds, or are interested in upgrading to
higher speeds. Packet is basically a cooperative exercise,
and lone wolves will find very little of interest to do.
So the first thing you want to do is find out about the
packet groups in your area, go to their meetings if they
have them, and learn what's happening locally. If what they're
doing sounds interesting, or you're the type of leader who
can get them cranked up to do something interesting, then
packet is for you. Otherwise, don't bother, you'll quickly
find yourself bored to tears.

Gary

I'm trying out PaKet 6.1 and I am having a problem using their editor. According to the on line manual, I'm supposed to be able to do an <alt> E and it is supposed to start up my text editor and let me edit the selected file. I have tried several editors like notepad.com and they all do the same thing. When I enter the <alt> E, it askes me to select the file and then when I do, it very quickly displays "out of memory" up in the let corner (for just a split second) and then goes back to the PaKet program. I am running under Windows 3.11 but I have tried it from a DOS prompt and it makes no difference. If I go to the DOS prompt from windows (DOS shell), it says I have well over 500K available so I don't understand. Anybody out there experienced the same thing and have an idea what am I doing wrong?

Thanks to all for reading this.

>A few friends and I wish to set up a simple, low speed message
>network (digital) on 80m using straight CW transmitters.
>
>Is there an established way of doing this?

Sure, add a varactor, or a transistor switched trimmer capacitor,
to the oscillator of the CW transmitter. That'll give you FSK.
You *don't* want to use on/off keying (OOK). That costs too much
in demodulator performance. Even with an ideal matched filter
detector and a jitter free coherent receive data clock, you still
need to boost transmitter power 6 db over a FSK transmitter in
order to maintain the same BER with OOK.

If you don't have a stable coherent receive data clock, IE a
clock perfectly coherent with the transmitter clock, and your
demodulator isn't an ideal matched filter, say just a simple
envelope detector, then the performance hit can be 20 db or more.
That may not matter if signal levels are always more than 20 db
above the noise, but I wouldn't count on that being the case on
a summer evening on 80 meters.

FSK isn't as good as antipodal PSK or CPM (Continous Phase
Modulation), but it's lots better than OOK. QPSK has essentially
the same noise performance as PSK if the dibits are Grey coded,
but with twice the data bits per baud. That's what I'd use on
80 meters if I didn't want to get too complex in the modulator
and demodulator, yielding a theoretical 600 bps on a 300 baud
channel. DPSK is another alternative since it is self-clocking,
thus removing the requirement for DPLL clock recovery. You do
take a 3 db performance hit with DPSK over straight antipodal
PSK though. Both of those methods would take considerably more
modification to the CW transmitter to generate, though the
demodulator can be a bit simpler than an ideal FSK demodulator.

But if you want the simplest system with reasonably good performance,
use FSK with a shift as near 1000 Hz as possible (the legal limit under
Part 97 on 80 meters), and use a pair of matched filters and an adaptive
slicer as the demodulator. Irv Hoff's old design will do for async, using
88 mH toroids and a discrete slicer, though there are better ways. Dale
Heatherington's tracking data detector following a pair of switched
capacitor filters comes immediately to mind, backed with a baseband
DPLL for clock recovery, and of course there are simple DSP solutions
as well that would be even easier to implement.

Example source in Vol II of "Digital Signal Processing Applications
Using The ADSP-2100 Family" implements this sort of demodulator,
and runs on the $80 Analog Devices DSP EZ-kit, or could be slightly
modified to run on a Cardinal soundcard (someone has already done this
and was selling the package at Dayton last year).

Wider shifts work better in additive Gaussian white noise than bandwidth
constrained systems if proper demodulator correlation is used, and they
also offer a bit of frequency diversity to cope with selective fading.
Of course they don't do as well against narrowband interference in the
receiver passband, and they do take up more spectrum than narrow shift.
It's a tradeoff. At lower HF and MF, the advantage of the wider shift
usually prevails when using relatively unsophisticated techniques.

Ideally, you'd use 1/2f CPM (called MSK) with trellis coding and
a constraint length of 256 bits or more using a convolutional
encoder and Viterbi decoder, but that's well beyond the scope of
simple systems used with unsophisticated CW transmitters. You'd
have to gut the LO and rebuild it as a quadrature modulated source.
That's really not *too* hard, and the EZ-kit can supply modified
raised cosine I and Q to a pair of MC1496s or DBMs, but I don't
think you're really contemplating that much of a rebuild. Slapping
a trimmer and a transistor switch on the tank of the oscillator
is lots easier.

4038. Establishing PACTOR/AMTOR "Node"

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-09-07 00:00:00 UTC
From: John Agar <njs265@freenet.mb.ca>
Message-ID: <Pine.SUN.3.91.950907014722.24468A-100000@winnie.freenet.mb.ca>
Source record: 41475

Hopefully this is the right newsgroup in which to present the following.

I have been delegated by an interest group within the Winnipeg Seniors Radio Club to acquire information re establishing a PACTOR and/or AMTOR "node" for Canada and world-wide mail forwarding.

The club has a good HF station based on a Kenwood 950 xcvr and excellent antennas at 95 feet. The location is ok also...south, central Canada and no PACTOR/AMTOR "node". The station is staffed daily from 9 a.m. to 3 p.m. (and longer if necessary).

The establishment of a HF PACTOR node would contribute to the Winnipeg and Manitoba VHF/UHF network. The U.S.A. south of Manitoba, via the forementioned network which links to North Dakota would also benefit. The local sysops will APlink mail for forwarding to the club station and vice versa.

Sooo......we need "boodles" of information. PACTOR info. APlink info. Connection HF to VHF info; and on.....and on! The club needs to build a data base regarding appropriate hardware/firmware and software. What equipment are you using and how; plus your opinions and if you had your "druthers".

There are computer wizards, electronic technicians and engineers in the group so they should be able to cooperate and cope with reasonably "high powered stuff".

Suggestions re pertinent books, papers, appropriate equipment, modifications, etc. will be gratefully accepted.

4042. WEFAX thru SB16 with ASP?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-09-08 00:00:00 UTC
From: piver@news.abo.fi
Message-ID: <42p0ff$7b7@josie.abo.fi>
Source record: 41479

There are boxes that go between the communications reciever and the
serial port for converting WEFAX and other stuff to legible form.
Now, in a sound-card group someone mentioned that a SoundBlaster with
ASP (a signal processor) can do the same thing. I was wondering if anyone
knows of PD or shareware or other cheap/free software to achieve this.
If this is FAQ I apologise, likewise if this is the wrong group for this.

Thank you!

NOTES OF INTEREST:

Easter Island, Salas y Gomez, XR0Y and XR0Z. A variety
of computer based communications techniques have been
implemented for this DXpedition and it is planned to operate
around the clock using all bands and all communication
modes legally allowed. XR0Y will be on 5-20 Sept.. XR0Z
7-11 Sept. They ask for real signal reports rather than
the usual 59/599 as is needed to study propogation. Duping
is invited but only on different bands and days. Logging
with CT so they will know if you are a dupe. QSL WA3HUP.

Barbados, 8P. Sigi, DL7UUO announces his next trip as
8P9II and will be active from here from 24 Sept. to 12
Oct. He works mostly CW, sometimes SSB and possible
RTTY. Skeds welcome.

South Shetlands, VP8. When VP8CQS was queried about
Non-receipt of QSL cards from, DL1EHH, he said to be
patient, logs are difficult to get to him. They will
eventually be answered. Some stations have QSL'd a
second time to operator's home call of SP2GOW and have
received replies back withen a month.

THE VK2SG RTTY DXNOTES are also available on Internet via Telnet
or FTP at ab6z.ampr.org at reflectors dx@ve7tcp.ampr.org
and digital-dx@st.rim.or.jp See also the OH2BUA WebCluster
at URL http://www.clinet.fi/~jukka/webcluster.html

John -

As willi_r has already pointed out, the current generation of AMTOR/Pactor software for mail forwarding is WinLink. I might also suggest that you take a look at the SCAN program written by TY1PS - It is also available at the IDRS ftp site and works very well with WinLink. It is a Windows program which can run in the background while you use your PC for other things.

In a nutshell, you program SCAN with several frequencies that you want your WinLink station to monitor. SCAN controls your rig, scanning through the frequencies, stopping when another station links to you, and resuming when the connection is complete. This makes your station much more "available" because if you only monitor one frequency your station is unreachable whenever that frequency is in use.

You'll need a level converter between a serial port on your PC and the external control port on your TS-950. I think Kenwood's converter is called the IF-232, but you can build one for far far less. A schematic is contained in the SCAN help files.

:>--GaryM

I probably shouldn't post this since I don't know the EXACT subdirectory and
all, but look on:

ftp.ucsd.edu under /hamradio/packet. Somewhere there sould be a subdirectory
called mods...if not, then try:

oak.oakland.edu and look for some mod files there. On one of these sites if
not both, there are files for mods on all kinds of radios and a bunch on
Mitreks, Micors, and other Motorolas.

Hello, and thanks for reading my message.
I have for sale:
Commodore 128
1571 Disk Drive
Printer
Games Games and more games
ALL kinds of programs, to much to list.
All power supplies, and all cables, for everything
Includes all manuels.
Have lots of stuff, and I want to get rid of it..
I also have a DIGICOM tnc for packet radio, it all works with
nothing wrong with it.
I use all IBM stuff now, and I have no use for Commodore Stuff anymore.
I will sell it all for $130 shipped!!!
I just want to get rid of it, and I don't want to rip anyone off,
Thanks a lot...
If interested, Please E-Mail to begin,

I may not be of any help to you on the FT-736R infor, but I have a FT-990 and it has 2 different "data" ports on the rear of the radio. One is for rtty and the other is for packet. The packet port is a 5 pin din plug. I use this port for all the digital communications. When I press the PKT button on the front panel, it selects the LSB as well. This port is active at all times, it also disables the mic port. I talked to the Yaesu reps at a local hamfest and they said this would work fine.

I may not have understood your inquery fully, however when you hook the TNC to the FT-736R just try to put the rig in the FM mode instead of the pkt.

Hope this info will help.

If you want to reply to me the my e-mail address is jivey@companet.net. I just happen to notice that i was connected on my daughters address.

Good luck!!!

It doesn't matter how many MHz, or whether you have a 486. It matters what Operating System you are running. In a single task OS like DOS, you don't care that the CPU is at 100%. It just doesn't matter. But a Unix or any multitasker must do a context switch 100 times a second to switch between the tasks. This context switch is not instantaneous. Any modem simulation in software will suffer as the CPU switches between the 50 - 100 tasks that are running.

Now that you know that, you can forget about building a software modem in Linux. Why waste money on dragging your OS down to the modem level, when you can offload the work to a serial chip. A 16550 chip/or clone will take a couple microseconds to process, while a Baycom will take several seconds to process (while the WHOLE machine waits). It doesn't take a rocket scientist to figure out which way to go. Spend $20 more and buy a real TNC, or stay with DOS.

>Is there any technical info on Baycom packet modems around? Like exactly
>what needs to be done in software, because I think I'm confused about what
>is actually going on.

Take a serial chip. See what it does. Then make a program to do that. Use a couple lines of the RS-232 port, and watch the level. Every time the level changes, interrupt the CPU and process the bit. Everytime you want to transmit something, stop the CPU processes and send out the bits.

Pretty dumb huh?

Here's a better idea. This works generally on WWW. If the first one you
try doesn't work, delete the tail, and try again.

In this case:

http://www.acs.ncsu.edu/HamRadio/

is probably a better place to start.

>buy" books...
>Pietro Carratu'

The first book you reference is a professional technical book.
While the theory and historical overviews are of value, there's
little or nothing of direct application to amateur radio packet
practices as they exist today. (Though you should be able to
glean some ideas about what is wrong with current practices.)

The second book is a very simple "how-to" book, dealing with
things like how to wire a cable between a TNC and a particular
brand of radio, what common TNC commands do, etc. Some of the
information is either out of date, or just wrong, but it does
have some useful information for the beginner setting up a station.
(Packet practice is a moving target, and it's difficult to write
a book that will stay current and relevant at this level.)

The ARRL publishes 6 packet/digital specific books.

"Your Packet Companion" is somewhat of the same scope as
the Roger's book, but with a bit different slant. Again
it is aiming at a moving target, but it's a bit more
general so it may hold up a bit better. Owning both
books could be useful, keeping in mind that some of
the themes expressed in these books could be obsolete.

"Your HF Digital Companion" is, like its namesake above,
aimed at the novice digital operator, this time operating
at HF. In addition to packet, it covers RTTY, AMTOR, PACTOR,
Clover, etc as they apply to the HF operator. Again, these
are moving targets, but you have to start somewhere, and
this is a good starting point for the HF operator.

"Packet: Speed, More Speed and Applications" is a practical hands on book about higher packet speeds than 1200 baud. For the most part, it's a project and idea manual, though applications like APRS are covered as well. Not a beginner book, but good for those looking to step up from the beginning level on VHF/UHF and wanting to get the soldering iron or compiler hot.

"NOSIntro: TCP/IP Over Packet Radio" is a hands on guide to the TCP/IP networking software used in amateur radio. It focuses on one particular implementation for the IBM PC and covers it exhaustively. This is a good way to take your first step into TCP/IP operations.

"AX.25 Amateur Packet-Radio Link-Layer Protocol" is the standards document for AX.25. This is not for the beginner. Rather it is aimed at those programing and implementing the AX.25 specification.

And finally, there's "Your Gateway to Packet Radio". This is more dated than the other intro books listed, but still has some good things to say, and probably deserves a place on the bookshelf.

Let me re-emphasize that amateur packet and digital operations in general are moving targets, works in progress. No book is going to offer you more than a static snapshot of practices current at the time it was written. Don't take much that you read in any of these books as graven in stone. Amateur digital is still in its infantcy, and is (or should be) rapidly changing as better methods are adopted and better understanding of the operational aspects is achieved.

From: kwick@mitre.org
Message-ID: <kwick-1009950100350001@mbppp4.mitre.org>
Source record: 41613

Would like to find some C-code that compares a "received" ASCII
text file (using non-ARQ modes like AMTOR FEC, RTTY, etc.) with a stored
"correct" one and comes up with a sensible count of the number of
character "errors" in the received file.

"Error" needs to be defined precisely of course; I'll leave that up in
the air for now. Because the received file may not have the same number
of characters as the correct file, this seems to be a non-trivial task
for a computer (although easy for a human), but surely one that has
been solved somewhere. You can E-mail me at kwick@mitre.org. Thanks.

: Any ideas out there?

The packet assembly/disassembly is still timing sensitive even under this operation. The Baycom is merely demodulating the tones into a data stream. With no buffering, you will lose data. Now give this a thought. Build in a 512 to 1024 byte buffer so you don't lose any of the data stream, build in enough smarts so that it has FIFO operations. The average Baycom modem costs around $50.00. Can you build the parallel version with FIFO buffer for $80.00 or less? If it's over $85.00, you might as well go with a used TNC.

From: nordlund@teleport.com
Message-ID: <42v6cm$5uf@maureen.teleport.com>
Source record: 41621

I was wondering if many amateurs use 6 meters for control of model planes, etc. The ARRL handbook provides minimal infromation, leading me to believe that it is not really common. My basic questions follow:

- Are there any commericially manufactured transmitters that are for amateur use (out of the box), or are all units home-brewed or modified?

- Have the new channel assignments, mentioned in the handbook kicked in yet, or is it based on local preference?

- Is there a newsgroup or book which can provide information on common practices, modulation schemes, and other conventions?

Thanks

I think, without actually doing a Fourier analysis, that that would
increase occupied bandwidth because the transistion from 2400 back
to 1200 would always occur at a 180 degree phase reversal, IE a maximum
step discontinuity. For sure there would be a problem if the transmission
system suffered harmonic distortion because the second harmonic of
1200 Hz would now mimic the 2400 Hz tone. I'd guess that's why the
tones aren't harmonically related in the standard.

That's just a quick gut reaction, analysis should yield the real
story.

Gary

I'm looking for a communications expert to gather data, document and then testify in court. I need someone to identify the frequency (bandwidth) my thoughts are broadcasted on. The transmission must be traced back to the repeaters and ultimatly the source.

Testamony of the transmission and what was personally heard must be included and fees for your services will be paid at time of settlement in dirrect proportion to the settlement. I suspect if you do your job correctly the settlement (and your fees) will be substantial enough to travel from other states to perform your task.

I don't think your thoughts are being broadcast, as the brain doesn't use RF.
Even if the EM fields coming out could be measured (EEG), I doubt anyone
could decode them at this stage in our technological development.

FYI: Expert witnesses are generally paid a pre-agreed price, independent of
settlement, and rarely will work on contingency.

>PLEASE HELP !!!

The IC-245 will probably do fine for terrestrial work, so I'll limit my comments to the satellite side.

I don't recall the SSB tuning step of the IC245, but you want to be able to step in 10 Hz increments for doppler tracking. 100 Hz steps will sort of work, but 10 Hz is much better. I seem to remember that the IC245 had some sort of funky dual concentric knob tuning that probably couldn't be easily modified to take the up/down signals from a satellite modem for automatic doppler tracking so you'll probably have to track by hand.

Note, you need small tuning steps in FM mode too, for the birds that transmit that way, IE Dove, but the slop there is greater and you might get away with 5 kHz steps, though 1 kHz or smaller steps would still be better.

As I also recall, the IC245 has a lousy noise figure, but a preamp can fix that. It also has only broad selectivity, and I don't know if you can fix that with a filter swap. You need to be able to use a 500 Hz filter on receive. Otherwise the SNR can be degraded too much for good reception. An outboard audio DSP might suffice.

The IC-245 can probably be made to work after a fashion, but you'd be much better off with a better rig. Even an IC-211 can be modified to work fairly well, and those show up at hamfests (here in the US) for as little as $125 from time to time. I used one on Oscar 10 for a while. I installed a Mutek front end and added an external audio filter (not DSP in those days). I made RTTY contacts through Oscar 10 with that, but it was sort of lame. I ended up cascading the IF output of the IC-211 (it has a panadaptor port) into an IC-745 and used its filters and tuning. Essentially, I

was using the IC-211 as a tunable receiving down converter. That worked pretty well.

Ideal radios would be the IC-275 or a FT736R, but they're going to be serious money, even used. You might find a better deal on the older IC-251 or IC-271. They aren't great, but they'll do. I'd avoid the Kenwoods, unless you absolutely can't find anything else.

I'm assuming you don't have a HF rig. If you do, however, a transverter could be a good solution instead. SSB Electronics makes lovely units, but an old Microwave Modules unit can be made to work for a lot less money. Or you could build your own, either from a kit or from scratch. The RSGB VHF DX Book has some good designs.

I just had a thought. Rick Campbell designed a SSB exciter kit that I believe could be modified for direct I and Q modulation. That might make a wonderful platform for an advanced modem. You could feed it to any of his no-tune transverter kits. I and Q could come from/go to a DSP evaluation board, like the Analog Devices EZ-kit. Hmmm. I've got to look into that. RF modems are better than trying to stuff digits through a voice grade radio.

Gary

4097. Re: Baycom for Windows?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-09-11 00:00:00 UTC
From: Jim Devenport <jdevenport@lanl.gov>
Message-ID: <431vei$84n@newshost.lanl.gov>
Source record: 41395

Since when will any BAYCOM version "run" from Windows?
Sure, it can be invoked and the screen will display, but
the timing is all messed up to the point where it will not
successfully transmit nor decode packets. Unless some new
version has been introduced, baycom MUST be run from DOS
only, no windows in the background at all or the timing
will be completely out of whack. Now, if I'm wrong, and
someone has figured out a way for Baycom to work from
windows, I'll be most happy to eat the flames just so long
as someone tells us how to do it successfully. I'd LOVE to
be able to run baycom from any version of Windows.

I don't know why it would start locking up only recently,
but every time I've had or heard about keyboard lockups the
cure has been to stop using baycom Version 1.5 and go back
to Version 1.4, which has less onscreen help features and a
beacon bug but is much more reliable than 1.5 in my
experience.
You might also try getting another copy of baycom in case
yours is somehow corrupted.

4099. Terminal mode software

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-09-11 00:00:00 UTC
From: Tim Kearsley <Tim@cirrus.demon.co.uk>
Message-ID: <810804519snz@cirrus.demon.co.uk>
Source record: 41397

Hi,
I have a piece of software which is talking to a TNC in terminal mode (NOT host mode). Unless I am missing something very simple, I can't see a way of the software knowing, when a connection occurs, whether the connection was initiated by the local TNC or a remote TNC. All that comes back from the TNC is the "*** CONNECTED to ....." message. Is there any way of directly determining which end of the connection initiated it?

Thanks in advance for any suggestions.

Tim Kearsley. tim@cirrus.demon.co.uk

4100. radio control software

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-09-11 00:00:00 UTC
From: steve.hajducek@bytewise.org
Message-ID: <127.1888.29@bytewise.org>
Source record: 41398

Subject: CAT Control Center (CATCC) Press Release.
Date : 1995 - Mon. Sept. 11 10:25 Local/ Mon. Sept. 11 13:25 Zulu
From : Steve Hajducek, N2CKH

The Shareware/Trial version of CATCC, CATCCjr, is about to make its debut. On September 28, 1995 CATCCjr will be placed on the ByteWise BBS for downloading as CATCCjr1.ZIP through CATCCjr4.ZIP respectfully. It will also be uploaded to the ARRL BBS and other popular Amateur Radio BBS systems and FTP sites. After the files have successfully been transfered to all sites, a message listing all sites will be sent via e-mail.

The CATCCjr version is basically a stripped down beta version of the full commercial version. It is being made available to allow potential users of CATCC a method to sample some of the latest features and comment on the software prior to purchase.

CATCCjr is NOT a supported product, it is not a complete product, it is only a trial version. However, should it meet the users needs, it can be used forever without any registration. However, CATCCjr will remain the copyrighted property of N2CKH.

```
=====================================================================
| |
| Pricing for CATCC has been set at $49.95 U.S. (plus $10 U.S. |
| for the bound user's manual) plus 6% N.J. state sales tax (and |
| $7 U.S. shipping and handling within the U.S. and $15 all other |
| locations). All shipping within the U.S. will be by U.S. Priority |
| Mail. A tenative shipping date has been set for the first week of |
| November, 1995. Orders will be shipped in the order received, |
| payment in U.S. funds by U.S. bank check or U.S. Post Office |
| money orders. Cash will be accepted, however, cash orders are NOT |
| recommended, especially from overseas. |
| |
=====================================================================
```

CATCC is the application Amateur Radio has been waiting for. It provides FULL control as provided by the equipment manufacturer of your C.A.T. radio via the computer. With a headset/boom microphone and foot switch an operator can literally keep their hands on the keyboard/pointing device and work'em/log'em faster than ever. With the DX-Graph(tm), DX-Filters(tm), Band-Watch(tm), Accu-Rotor(tm), AutoMode(tm), AutoGrab(tm), DX-Calendar and DX-Sleuth(tm) your always on top of the action and you'll have the latest in logging, analysis and reporting.

MS-Windows based, written in Visual Basic, C and Visual dbase, the CAT Control Center is fully event driven. It supports eight serial ports for HF and VHF rigs, Packet TNC (DX-Cluster monitoring), 2nd TNC for RTTY, Pactor etc., MM-3 electronic keyer, Rotor control and other peripherals. Also supported are parallel printer ports (3) for voice keyers, antenna switch boxes and others.

Basic operation of CATCC/CATCCjr involves an H.F. C.A.T. transceiver and VHF Packet TNC monitor DX spots. As spots are recieved, they are displayed and made available for selection by the user. Audible spot announcements and various DX-Alerting sound effects are available, when the user via pointing device or keyboard selects a spot, the C.A.T. transceiver is place on the spots frequency (and optionally mode), the spots call is placed in the log window and depending on mode and option selected a 59 or 599 is placed in RST s/r log windows as well. When worked, the user clicks on log, and all information, including the actual information from the H.F. rig (VHF also depending on make and model of radio) is logged.

This description sounds simple, and it is. It sounds like the basic computer/tnc/radio scenario, and it is. But, CATCC has so much more going for it that to try and write any more here does not do the software justice. It must be seen and used to fully appreciate the CATCC user interface and software features. The CATCC_PR.ZIP file which is available for downloading from the Bytewise BBS and the ARRL BBS has additional information and .BMP files of captured actual screen displays that provide more of a feel for the actual software in operation.

Currently supported are Yaesu radios, with Kenwood support being integrated. Sample Kenwood control programs have been written as of this date, but not fully integrated into CATCC. Planned is support of ICOM, Ten-Tec, JRC and SGC radios as well.

The Shareware/Trial version of CATCC, the CATCCjr version, will have many of the features of the full commercial version, it is basically a stripped down beta version of the latest commercial version. The missing features will include full logging and award tracking, only a CT compatiable .RES files will be created. Also missing will be the full DX-Graph(tm) component, and DX-Sleuth(tm) and other features that will only be available in the registered version.

The registered version, CATCC, brings with it full logging and award tracking capability supporting DXCC, WAS, WAZ, IOTA, VUCC with excellent analysis, reporting and label printing capabilities, as well as the full DX-Graph(tm) and DX-Sleuth(tm) real-time analysis tools. Registration obviously entitles the registrant to product support via the Bytewise BBS and Internet e-mail. Also one FREE upgrade (postage and handling required), resonably priced upgrades in the future, the CATCC user Newsletter and full access to the Bytewise BBS.

It is planned to add new features, such as new hardware support regularly, and to improve and refine CATCC, with upgrades about every six months or so.

For additional information on CATCC call the Bytewise BBS at 1-908-363-2760 and download CATCC_PR.ZIP which has a demo of the Accu-Rotor(tm) program module and other example programs or send e-mail to info@bytewise.org

/s/ Steve Hajducek, N2CKH

Accu-Rotor, AutoGrab, AutoMode, Band-Watch, ByteWise, CATCC, CATCCjr, DX-Calendar, DX-Graph, DX-Alert Filters, DX-Sleuth are trademarks of N2CKH.

4101. NOAA Satellite AM FAX demodulator plans wanted!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-09-11 00:00:00 UTC
From: scicon@ix.netcom.com
Message-ID: <42vvr5$2hk@ixnews5.ix.netcom.com>
Source record: 41631

I am looking for a schematic for a AM fax demodulator for receiving
NOAA satellite pictures direct from the satellites.

I tried to build the interface described in the docs for JVFAX, but
there is too much info left out and I can't get the interface to work.

Does NOAA publish any schematics?

Does anyone have the schem. for any commercial interfaces?

Note that this is different from the simple interfaces for receiving FM
FAX on the HF bands. AM demodulators must have seperate clocking
circuits.

Thanks... Dan KE6LBX San Diego, CA

>I will use the controller from a boat in Mexico most of the year and from a
>motorhome for a few months in the States. HF mostly in Mexico. 2M mostly in
>the states. I'd also want GPS capability.
>appears the Kantronics Kam Plus would best fit my
>needs. Can anyone affirm this or give me any alternatives{
>need

Based on your needs the KAM is about your only chose for HF operation with GPS capability. There is a multitude of programs that you can use with the KAM.

Be sure that the KAM has version 8.0 formware when you buy it. This is the version that includes that GPS support (as well as GTOR monitoring).

An applicable program can be found at the FTP or WEB sites listed in this signature.

4103. CLOVER users, where are you??

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-09-11 00:00:00 UTC
From: Danny Higgins <Danny@edstks1.demon.co.uk>
Message-ID: <810806780snz@edstks1.demon.co.uk>
Source record: 41633

Hi. I operate CLOVER occasionally, but plan to be more active when I sort out my antenna problems with my neighbour!!

I got the new HAL P38 board direct from HAL for $395 and it works well. I think the main CLOVER activity is on 14065.0 or 14066.0, usually on a 500Hz step. I have had a few contacts and hopefully there will be more activity now that the P38 is available at a reasonable price.

4104. NET_Mac2.3.55.sea.hqx.text

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-09-11 00:00:00 UTC
From: adam@iag.tno.NL
Message-ID: <9509111343.AA11078@iag.tno.nl>
Source record: 41634

```
The Netherlands, Sept 11, 1995.
Hello dear reader,

NET/Mac v2.3.55 was born...

For those who don't know NET/Mac... NET/Mac is the application that
supports TCP/IP over packet-radio, which means, that hamradio operators
can use NET/Mac for their wireless TCP/IP network...

In this version of NET/Mac the following mods/features were implemented:

- A cosmetic enhancement for the 'netrom nodefilter' output
- Corrected some minor things
- Don't record the 'retr n' command in the popmail-file
- Force ARPA-net date-format the FTP-welcome message
- Introduce FTP-commands 'ascii' and 'binary'
- Return mail that has no hostname for destination
- Support 'ftext3 [<text>]' and 'ftext4 [<text>]' commands
- Terminate idle popmail-sessions after 127 retries
- Use ARPA-net date-format to calculate the age of outgoing mail
- NET/Mac does NOT support the new Buckmaster CD-ROM's HAMCALL
database yet... I am trying to convince Buckmaster that I need
the new data-encryption-method, but as of yet they are not ready
to release a description of the encoding-algorithm...
The old CD-ROM's remain fully supported...

This version obsoletes all versions of info-mac/comm/radio-net-mac in
the Sumex-Aim.stanford.edu (and it's mirror-) archives.

The new NET/Mac has (hopefully) been uploaded to:

- oak.oakland.edu, to the directory /pub/hamradio/mac/digital
- ftp.ucsd.edu, to directory /hamradio/packet/tcpip/incoming.
If it's not there (anymore), then look at /hamradio/packet/tcpip/mac.
- hamster.business.uwo.ca, to directory /pub/amsoft

NET/Mac will be uploaded to PI8HVH.AMPR.ORG, directory public/mac.

Yep it sure works on a 4.77 mhz machine, just make sure that there are no other tsr's running. TFPCX as used for TPK / Graphic packet etc requires a clock speed of 8 Mhz at 4.77 it will just hang up.

I've found that most hams in the area who are also RC enthusiasts have at least some 6 meter gear. It's very nice to go to a group fly and be the only one on your band. You get to fly a lot more. :-)

Most people use commercial equipment, so there isn't much point in the handbook covering it in gruesome detail. But they do have some reasonable info on it. I found it helpful.
>
>- Are there any commericially manufactured transmitters that are for amateur
> use (out of the box), or are all units home-brewed or modified?

They are commercially available from most of the RC radio suppliers. Mine are from Futaba and JR.
>
>- Have the new channel assignments, mentioned in the handbook kicked in yet,
> or is it based on local preference?

The manufacturers seem to be offering the new channel sets these days - channels 01 to 09 which run in the 50.800 to 50.980 range. Used radios may be channeled for the older 53 mhz frequencies above the repeater allocation (one of mine is)

>
>- Is there a newsgroup or book which can provide information on common
> practices, modulation schemes, and other conventions?

I haven't seen one, but you can show up on rec.models.rc.misc or any of the other rc models groups and get lots of information there. The current gear mostly uses FM modulation with a 50 Hz (20ms) frame rate of up to 8 channels. 1.5 ms pulses are normally the center of channel, with 1ms and 2 ms being the extreme rotations.

>If this is FAQ I apologise, likewise if this is the wrong group for this.

You can build a great little 1-chip interface, connected to and powered by
your computer RS-232 port, that will allow SSTV and 64-level gray scale
WEFAX reception. The circuit is in the documentation file in the freeware
(yes, FREE not even SHAREware!) program JVFax70 program. That is a really
great piece of software written by a German ham for the ham community. It
even allows you the transmit SSTV and FAX images through the same interface!
Look around, you can probably find it in a local BBS.

I'd go for a TNC any time. Distributed intelligence makes sense even
where it is not as time sensitive as with packet radio. The principle behind
BayCom, IMO, is a crutch at best. What you save in bucks compared to the
cost of a TNC, you pay double afterwards in terms of nerves and frustration.
If it has to be cheap, I would get just the pcb and assemble the TNC
myself.

Great Money Making Opportunity!!!

Don't discard this. I almost did. But then I realized just how
powerful
the net is as a communication tool. It is for this reason that this
really works. Millions of people can find out how to do this in one
night. The more people try this the faster it works. You can make
hundreds of dollars in one week, easy. It's the beauty of the net....

Please do NOT change anything contained in this letter EXCEPT as
directed!

EARN AS MUCH AS $100,000.00 OR MORE IN 30 DAYS, LEGALLY!

EARN MORE THAN EXTRA MONEY!!
YOU WILL BECOME FINANCIALLY INDEPENDENT!!

Here's how to do it.
IT WORKS EVERY TIME! Again don't change anything.

Follow these instructions exactly and you could make $100,000
in the next 30 days. This program REALLY works. It makes money
for those who do it honestly! Take the time to read it COMPLETELY!

I know, ordinarily, we disregard these letters because they usually
don't
work like they're supposed to, but this ONE is DIFFERENT!

Carl Simmonds used this legal program last year and made $82,360 in
cash
the first time he used it. Needless to say, he quit his job
immediately
paid off all debts in full, and started another mailing.

Believe me, this is an EASY opportunity. You can do this all on your
computer, by "JUST PRESSING A FEW BUTTONS". You will EASE YOUR

FINANCIAL
PRESSURES, and begin to make GOOD things happen for you and your
family.
READ ON!

* * * * * * * INSTRUCTIONS * * * * * * *

[1] First Send $2.00 (cash only) inside a sheet of carbon paper or
construction paper, and send a self-addressed, stamped envelope to
each
of
the DEALERS (1 through 4) below for the recipes they offer.

[2] Save this letter on disk. Remove the name, and recipe title
that
is in the number 1 position. Move the others up a space. Put your
name,
address, and the name of your recipe in the number 4 position.

[3] Post this file just as it appears (with your name, etc.) in 10
different
places on-line (newsgroups, forums, etc.). Do the postings between 6
a.m.
and 7 a.m. Friday, Saturday or Sunday to get the highest position and
have
your posting read first. Ten postings should yield about 100
responses,
which should then yield about $100,000.

[4] ***When the money begins coming to your HOME MAILBOX, put your
recipe
in the provided SELF-ADDRESSED, STAMPED ENVELOPE - sit back, smile,
and
know that you NOW OWN AN HONEST AND EASY SMALL HOME-OPERATED
BUSINESS! KNOW
ALSO, THAT YOU HAVE DONE SOMETHING SMART TO ACHIEVE FINANCIAL
INDEPENDENCE!

* * * * * LOOK AT THESE FIGURES WITH ONLY A 15% RESPONSE! * * * * *

Step 1: Fifteen dealers mail at least 15 letters each with your name
in
position #3 AND send you a request for a recipe and $2 each or $30.

Step 2: Two hundred and twenty five (225) dealers mail at least 15
letters with your name in position #2 AND send you a request for a
recipe and $2 each
or $450.

Step 3: Three thousand three hundred and seventy five (3,375) dealers
mail at least 15 letters with your name in position #1 AND send you a
request
for a recipe and $2 each or $6750.

Step 4: Fifty thousand six hundred and twenty five (50,625) dealers send
you a request for a recipe and $2 each or $101,250.

TOTAL CASH RECEIVED (15% RESPONSE) $108,480.00
ELAPSED TIME: 30 days! Everyone responding immediately.
ADVANTAGE: $8 Initial investment.

Professional care has been taken to insure that this Marketing Plan does
NOT violate any laws! (Reference U.S. Code, Title 18: Section 1302, 1343,
and TITLE 39, Section 3005).

The key factor is that we are Mailing Merchandise...OUR TREASURED RECIPES.

Be honest in every way. Be sure to keep accurate records of income
for Income Tax purposes.

GOOD FORTUNE TO YOU!

4114. GTOR users, where are you?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-09-12 00:00:00 UTC
From: ilkka.kontola@nmp.nokia.com
Message-ID: <ilkka.kontola.68.0008D323@nmp.nokia.com>
Source record: 41401

The GTOR activity on 20 m seems to be very low at least in Europe.
I do not have experience on other bands.... just replaced my 14 MHz dipole
with R7 two days ago.

Is there any GTOR BBSs QRV? 7Z1AB was QRV on 14.080 MHz (mark) but
now they are QRV only on Pactor (and AX.25 on 21 MHz).

IMHO we should test GTOR much more thoroughly (before we possibly junk it).

Disclaimer: No connection to Kantronics. Not even a satisfied customer due
to their very unfriendly Kantronics/rfConcepts VHF/UHF amplifier customer
support.

>much quicker? Packet radio is too slow. I only need a few hundred
>meters.

I know the feeling. There is a group of amateur radio operators ('hams')
around here that want to go faster. We have investgated some other options.

The best for your situation would probably be the AT&T WaveLAN. They're
.25W spread spectrum, and do 2Mbps. They are advertised to be able to do
5 miles with the proper antennas and a good line of site, but reports are
that they don't actually achieve this. They operate under FCC Part 15, so
you would have to check your local regulations. The local AT&T representatives
would be the best ones to ask.

BTW, they are about $600 each and go in an ISA slot.

If you want more information, it would be best to ask in rec.radio.amateur.
digital.misc (where followups have been directed). If this is not correct,
someone should be kind enough to redirect followups again.

> Tim Kearsley. tim@cirrus.demon.co.uk

Surely there is, Tim. Assume that only your software is talking to the
TNC user port. If your software sent "C CALLSIGN" and the message reply
is connected to CALLSIGN, then your end initiated the connection. Now let
me make another assumption that the TNC is relatively intelligent. Your
TNC could refuse an inbound connect request, then immediately return a
connect request to the station who attempted to connect to you.
You can parse the call from the CONNECT REQUEST message very easily. Many
relatively inexpensive terminal programs such as ProComm or CrossTalk have
some great scripting capabilities that would be quite functional for this
application. Posting a few more details about your requirements shuold
provide you with more detailed replies from folks more experienced than I.

Hi, I have a few queries, firstly, is it possible to digipeat via a satelite into a bbs (or to any other station) during a pass and if so, which sats are the best/most convenient to use? I run a BBS (ZR1MLV) in Mossel Bay, RSA and the next nearest bbs is +/- 400 km away.....I also only operate on vhf (mail forwarding done via internet). Main problem is that hams a bit far off cannot connect unless conditions permit and I was therefore wondering about digipeating via satelites?

Secondly, Some of the local guys have Vic20/64 pc's and would like to know if these and can be used for pr, if so, can they be used with the Baycom modem/software?

Next and lastly, I will be migrating to New Zealand end of this year and would like some info on Ham / bbs activity in Chstch area.

many thanks & 73

Mark.

I saw this story in the local newspaper today, where it was apparently copied form the Hamilton, Ontario, Spectator.

Apparently Bell doesn't have any packet radio enthusiasts in it's ranks...

MOVE TO NET TRADEMARK UPSETS WEB SURFERS

Hamilton.

Bell Canada has applied for a trademark that would give it exclusive Canadian ownership of the words "the Net", a move that is infuriating people in cyberspace who surf the Internet.

Bell subsidiary Worldlinx Telecommunications Inc. is marketing electronic services under the name. Sarah Hastie of Worldlinx says the application was made in 1992.

"We certainly didn't have any nefarious intentions. We applied for this well before most people in Canada had heard of the Internet."

The company wants to use the trademark to market "communications, messaging and applications integration software", and a "portfolio of information management and electronic messaging telecommunications services, namely electronic mail, voice mail, information gateway and access, enhanced fax, electronic dictionaries." People can oppose the application for up to two months after the Aug.2 date of publication.

Personally, I think they've got a lot of nerve trying to trademark something that already IS a product name worldwide.

Perhaps someone can forward this article to the THENET group.

The C64 can use the Digicom modem/software, rather than Baycom, for
low-cost packet. I believe it was produced by the same people as Baycom.
The hardware and software are not compatible with Baycom.

4126. Radio for 9600 baud@UHF

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-09-12 00:00:00 UTC
From: pbutlalj@ia.net
Message-ID: <4332ef$m0j@hera.ia.net>
Source record: 41413
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.homebrew

Hello Everyone,

I was wondering if there are any suggestions out there for which radios are easiest to convert to UHF 9600 baud packet radios. There are several people in the area that would like to get on the air and it has been a while since anyone purchased any commercial radios that got converted to this mode. Of course we are looking at inexpensive and reliable radios.

Thanks for any information that would be available out there.

Try FTP.UCSD.NET

In /hamradio/packet/tcp you will find the latest packet programs including
TNOS. Be sure to look in /hamradio/packet/tcp/incoming for the lastest
updates.

Check the master list at ftp.ucsd.edu someplace in the packet or tcp/ip subdirectories of the hamradio directory. This lists the address coordinators by geographic location.
UCSD also has the master list of all ham IP addresses which have been assigned.

4130. Free Ham Test Simulators - Mac

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-09-13 00:00:00 UTC

FREE - NEW Macintosh HAM TEST SIMULATORS

Studying for a ham test and have access to an Mac?

Upgrade Fast! Simulate the test and get S T I M U L A T E D!

Scores of 90% or > even get applause!

The new Macintosh Ham Test Simulators are HERE (and there if you can FTP)!

o Novice Ham Test 5.0 SA.sea
o Technician Ham Test 5.0 SA.sea
o General Ham Test 5.0 SA.sea
o Advanced Ham Test 5.1 SA.sea
o Extra Ham Test 5.0 SA.sea

The latest version "5" feature:

HyperCard 2.3 as a stand-alone application (SA) eliminating
your need to have HyperCard. All you need is a Mac with 4
Meg of memory and version System 7 or greater.

Each version "5" Ham Test Simulator has the latest questions
as prepared by the Question Pool Committee.

Each version "5" Ham Test Simulator is FREE OF CHARGE and work the
same way as the originals did (written by Diana, KC1SP).

You may obtain a version "5" Ham Test Simulator by mailing me a *FORMATTED
disk (1 per test) and include a Self Addressed and Stamped disk mailer for
the return.

Each version "5" Ham Test Simulator is also bundled with a shareware CW
program called MacMorse 1.4 written by Doug, WB0EON.

Also included in the version "5" collection are text files that relate an
interesting variety of ideas about the best way to study CW and prepare
for tests.

Or warm your phone line and get JUST the tests:

America On Line - Macintosh Ham Radio Section

or:

ftp://oak.oakland.edu//pub3/hamradio/mac/theory-and-morse/AdvancedHamTest.sea.bin
(Aug 30th)
ftp://oak.oakland.edu//pub3/hamradio/mac/theory-and-morse/ExtraHamTest.sea.bin
ftp://oak.oakland.edu//pub3/hamradio/mac/theory-and-morse/GeneralHamTest.sea.bin

ftp://oak.oakland.edu//pub3/hamradio/mac/theory-and-morse/NoviceHamTest.sea.bin
ftp://oak.oakland.edu//pub3/hamradio/mac/theory-and-morse/TechnicianHamTest.sea.bin

Your comments and suggestions for future versions are always welcome. Stay
in touch
and good luck with YOUR next test!

4131. Macintosh TCP/IP - Latest Plus Docs

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-09-13 00:00:00 UTC
From: john@wd1v.mv.com
Message-ID: <john-1309950459350001@wd1v.mv.com>
Source record: 41418

Free - Latest Release of Macintosh TCP/IP software for Amateur Radio

NET/Mac v2.3.55 was born...

For those who don't know NET/Mac... NET/Mac is the application that
supports TCP/IP over packet-radio, which means, that hamradio operators
can use NET/Mac for their wireless TCP/IP network...

In this version of NET/Mac the following mods/features were implemented:

- A cosmetic enhancement for the 'netrom nodefilter' output
- Corrected some minor things
- Don't record the 'retr n' command in the popmail-file
- Force ARPA-net date-format the FTP-welcome message
- Introduce FTP-commands 'ascii' and 'binary'
- Return mail that has no hostname for destination
- Support 'ftext3 [<text>]' and 'ftext4 [<text>]' commands
- Terminate idle popmail-sessions after 127 retries
- Use ARPA-net date-format to calculate the age of outgoing mail
- NET/Mac does NOT support the new Buckmaster CD-ROM's HAMCALL
database yet... I am trying to convince Buckmaster that I need
the new data-encryption-method, but as of yet they are not ready
to release a description of the encoding-algorithm...
The old CD-ROM's remain fully supported...

This version obsoletes all versions of info-mac/comm/radio-net-mac in
the Sumex-Aim.stanford.edu (and it's mirror-) archives.

The new NET/Mac has (hopefully) been uploaded to:

- oak.oakland.edu, to the directory /pub/hamradio/mac/digital
- ftp.ucsd.edu, to directory /hamradio/packet/tcpip/incoming.
If it's not there (anymore), then look at /hamradio/packet/tcpip/mac.
- hamster.business.uwo.ca, to directory /pub/amsoft

NET/Mac includes interactive HELP if you are just starting out. I also include
a TCP.FAQ (Frequently Asked Questions) that even includes names and addresses
of regional gurus and a "by the numbers" list of what you do to get
operational.

Send me (1) one formatted disk and a *self addressed and *stamped disk mailer
marked TCP/IP... 800k or 1.4 Meg disks are OK but they MUST be formatted.

73,

> Does anyone know how I can obtain an IP address assignment?
> 73 Adrian N2ZIA

Look for IP activity locally. Connect to a call using JNOS or TCP/IP
and leave them a message. They will help you out.

If there is no local activity and you are starting up with another ham,
just pick two numbers and press-on. Later you can worry about
coordination, and change your address.

Here's some good numbers:

10.0.0.1
10.0.0.2
...etc...

Later when you want to coordinate, your IP address will be of the

44.x.x.x

Series. But it's not important. The idea is to have fun, not get
bogged down or waiting for coordination.

4135. Max TOR throughput?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-09-13 00:00:00 UTC
From: kwick@mitre.org
Message-ID: <kwick-1309951421320001@cronin-2ci.mitre.org>
Source record: 41422

TOR-users: Anybody know a good way of estimating the maximum throughput, in characters/sec, say, of AMTOR, PacTOR and GTOR in a perfect channel? For GTOR at a 300 bps channel rate, with no Huffman coding, I assume it's something less than 300/8 = 37.5 char./sec. With Huffman, somewhere above that.
You can E-mail me if you want at kwick@mitre.org. Thanks.

4142. Re: NOAA Satellite AM FAX demodulator plans wanted!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-09-14 00:00:00 UTC
From: jesus@simu1.ele.cie.uva.es
Message-ID: <439b82$jpv@simancas.cpd.uva.es>
Source record: 41293

Dan Walker (scicon@ix.netcom.com) wrote:
: I am looking for a schematic for a AM fax demodulator for receiving
: NOAA satellite pictures direct from the satellites.

: I tried to build the interface described in the docs for JVFAX, but
: there is too much info left out and I can't get the interface to work.

: Does NOAA publish any schematics?

: Does anyone have the schem. for any commercial interfaces?

I've build my own design to demodulate the WEFAX audio signal of the
eupopean Meteosat, that in fact is also an AM modulated carrier of 2400 Hz.
I don't have the schematics in a readable format, but they are simple. First
the AM signal is rectified in a full-wave rectifier and then filtered with a
low-pass Bessel filter. This filter is 6th order with a cutoff frecuency of
~1300Hz. This circuit uses 4 OP amp, 2 germanium diodes and a small lot of
resistors and capacitors (all the capacitors in the filter are equal). The
rest of the work is done with a PC A/D card and some software.

: Note that this is different from the simple interfaces for receiving FM
: FAX on the HF bands. AM demodulators must have seperate clocking
: circuits.

While the video signal is demodulated the sample rate don't worry, but keep
in mind the Shannon Law. Sample rate must be lower that the carrier
frecuency.

: Thanks... Dan KE6LBX San Diego, CA

Nope not at all Steve, a very good "means to and end"!! Maybe not in a
LINUX/UNIX enviroment but it was never meant to be like that. It was meant
to get people on air with packet radio with minimal cost and trouble while
gathering funds for the benefit of the home network of the author's! Not a
thing wrong with that.

It is all experimentation. If a linux/unix bod wants to produce a baycom
compatiable kernal/driver, let them, if is slows down the OS to a halt,
you can smile happily if it works well, wipe the egg of your face and have fun!

And that is the main point of Amateur Radio, HAVE FUN!

There's a package written by a ham in Malta which does just this (except
it doesn't need the ASP chip).

I think it costs about 50 dollars.

I'll make some enquiries, because I know at least one person who uses it.
He showed me it working, and it looked pretty smart.

Repeat after me.
If you want this to stop, send the message back to postmaster (usually
the sysadmin or system mgr) at his site. Try postmaster@gate.net.
Include the original message and senders account for reference.

Works (almost) every time.

Check the TAPR FTP site and this directory:

ftp://ftp.tapr.org/tapr/SIG/aprssig/upload/

Look for "MacGPS". It is written to interface with a Garmin GPS45, and
supports display, logging, uploading, and downloading of coordinates,
waypoints, and routes. Actually, it's pretty nifty.

What it doesn't do is work with a map. Oh, well, can't have everything. ;-)

4154. TOR Throughput

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-09-14 00:00:00 UTC
From: rwhiting@winternet.COM
Message-ID: <199509142139.QAA19826@icicle>
Source record: 41439

Ken, since the TOR's are all synchronous modes the maximum theoretical throughput can be calculated from the cycle time and info bits/frame. I calculate the following:

Cycle Time Info
Mode (sec) Bits/Frame BPS

AMTOR .45 sec 21 46.67
PACTOR-I 1.25 160 128.0
G-TOR 2.4 552 230.0

I don't have the info conveniently at hand for CLOVER-II and PACTOR-II. If you can't get it easily I can look it up for you.

I took the data from my lecture notes for the USTTI course I teach on packet radio theory and applications. I see my calculations for AMTOR, PACTOR-I, and G-TOR but not for CLOVER-II and PACTOR-II.

These bps's assume operation at the highest rate for the mode, e.g., 100 baud for AMTOR, 200 baud for PACTOR-I, and 300 baud for G-TOR.

The character rate for PACTOR-I and G-TOR sending ASCII is presumably BPS/8, or 16 CPS for PACTOR-I, 28.8 CPS for G-TOR. Although ASCII is really a 7-bit code so I wonder? Anyway, AMTOR (which is not ASCII nor transparent to data, i.e., sends only it's 7-bit coded upper case alphabet), gets 3 characters per .45 sec or 6.7 CPS.

The increase from compression will, of course, depend on both the nature of the data to be sent and the compression scheme. The Huffman scheme used for PACTOR-I and G-TOR assume normal English text character statistical distribution (there is no significant difference for German, e.g. PACTOR). Alternatively, G-TOR has a Huffman option assuming all upper case English text. It is my understanding that, given English text data are being sent, the compression ratio can reach 1:2, i.e., approach double the throughput. On the other hand, a binary file might be much less.

Of course, in actual practice on HF channels none of these modes achieves their maximum theoretical throughput. How fast the modes deteriorate under different channel conditions is another very interesting question. I'm sure you're aware of Teresa Young's data from HF channel simulations, for example.

Data from HF over the air tests I collected suggest actual throughputs (CPS) as follows: AMTOR 5; Packet X.25 4, PACTOR-I 10; G-TOR 24, CLOVER-II 16-50. Now these are really unfair comparisons because the tests were not made at the same time by the same experimenters, etc. No science here! I just mention the data to show that the real throughputs on HF channels may be significantly less (as I know you know anyway!). Data from channel

simulators gives a much better indication of performance under various channel conditions.

Hope this helps.

From: mattcrw17@aol.com
Message-ID: <43ab8n$p64@newsbf02.news.aol.com>
Source record: 41440

I would really appreciate any help or info on this project. Maybe somebody here has built something similar to this, and could E-mail me tips or schematics but do not post for my benefit because I do not frequent this group.

Okay, I need a DTMF pad hooked up to a inexpensize short range transmitter walkie-talkey, homebrew,or somthing like that. I need to have my reciever fire a relay or solenoid or something when the proper 4 digit code is entered. P.S. must be portable (DC) My problem is I have little expertise, but I could have somebody build it properly if it is too involved. Tips on where to salvage circuts from for this are also appreciated.

Thanx. E-mail me

The TNOS Support Site where the sources for all versions is available
at is located at ftp.lantz.com. Brian KO4KS (the author) typically
also uploads it to ftp.ucsd.edu also and it's probably best to download
it from their since it's connection is faster.

Ron

Reply to: RE>TOR Throughput

Rick: Thanks for the useful info. BTW, I think I recall talking
to you by packet and maybe by letter a year or two ago. If so, hello
again.

Your figures are close to what
I been recording (see below), but a little below the maxima
I've found, and a little below what the Kantronics guys report in
their QEX article on GTOR. For example, they and I have got max GTOR
throughputs in the low 40s chars/s, in my case with PTHUFF both on and
off. (I'm not sure if PTHUFF has any effect on GTOR compression;
maybe not.) Likewise, we both have got in the low 20s for PTOR with
PTHUFF ON and in the high teens (e.g., 17 cps) with it OFF. I Agree
that compression puts the throughput somewhere above the theory
max. Don't have an explanation of why PTOR seems to be a bit above
the theory max with PTHUFF OFF, though.

Maybe you'd be interested in joining us in a little project. We've
just written a Mac program (inThinkC) that runs automatic on-air tests
of AMTOR, PacTOR and GTOR between our KAM and a distant one. It connects
to the KAM's PBBS in each case, downloads a file to it, calculates the
transfer time and the throughput, breaks the link and sends these and
other data to an archive file.

We've done quite a bit of local (NVIS) testing in Massachusetts with
good and interesting results, and are now looking for KAMs farther
away to do more. If you're able and willing to join us, or know people
who are (if you can't), gimme a shout and we'll set up a sched. We'll
naturally share any data with participants. 73 Ken.

My father, W5UGQ is working on making the hardware to allow general
coverage receivers to receive MSK for use with DGPS.

When we get something to report on this, we will post it to the news groups.

Also, in the same ftp site is MacAPRS which takes GPS input and plots it
on a map. This program is really aimed at the Ham, but is fully useable by
the non-ham for doing GPS tracking. It can also take recorded GPS data
(NMEA data) and replay it from a file.

Notes of Interest:

LORD HOWE IS., VK9 - This operation gets underway 19 September
and continues until 26 September, including the CQ/DJ WW
RTTY contest (23-24 Sept). Outside of the RTTY contest,
they will operate CW, SSB and RTTY including the WARC
bands, in accordance with propagation opportunites.
On RTTY look for VK9LZ, on CW - VK9LX, and on SSB - VK9NM.
Operators are W6OTC, N4TQO, KE6FV, and W6/G0AZT. QSL direct
to Eddie Schneider, P.O. Box 5194, Richmond, CA 94805.

MALYJ VYSOTSKIJ IS. ex-4J1 - M-V Island will be reactivated
as OH2BU/MVI, and R1MVI starting 21 September and continuing
until 25 September. Operators will be OH1KAG, OH3KCB, OH3MEP,
OH3MMF, RA3AUU, RU3FM, RV6HY, and RA3AUM. CW, SSB and RTTY on
all bands 10m-160m will be used with four stations, except
during the CQ/DJ WW RTTY contest, during which time CW and SSB
will be limited to avoid interference on RTTY frequencies, which
will be 14084, 18104, 21084 and 28084 khz. QSL via OH2BU.
For last minute updates on the operation see the expedition's
WWW Home Page at http://www.spt.fi/~OH1KAG.

CE0Z, JUAN FERNANDEZ - Randy, K0EU, WITH K4UEE, and K0IYF
should be QRV as CE0Z now until 20 September. They have
promised CW, SSB and RTTY. RTTY frequencies are
7085, 14085, 18105, 21085 and 28185. QSL to K0IYF CBA.

ZONE 2 - Bob, W1VXV will be operating from Sept-Iles, Quebec
in Zone 2 from 22-25 September imcluding the CQ/DJ WW RTTY
Contest. All contacts will be QSL'd via the bureau unless
SASE's are sent to his CBA.

TURKS & CAICOS, VP5 - VP5C will be fired up for the CQ/DJ
WW RTTY contest by a team from PI4COM. QSL to PA3CAL.

ITU HQ, 4U - Mike, LX1KQ and LX1OM will be QRV from Geneva
for the CQ/DJ WW RTTY contest as 4U0ITU. They will be tuning
up a few days earlier as 4U1ITU. QSL to Carlo, LX1TI.

ARUBA, P4 - Jay WS7I will be in the CQ/DJ WW RTTY contest as P40JT.
Before and after the contest, (Sept. 21-28) look for him and
his XYL Betsy, who will operate as P40BT. After the contest
they will be operating all digital modes including Clover,
Amtor, Pactor and RTTY. QSL to WV7Y.

ANTIGUA, V2 - Steve, WF2S will put on a big push as V26Z in the
CQ/DJ WW RTTY contest. QSL via home CBA.

For next week's bulletin send your bandpass and notes of interest
to I5FLN at ZS5S.ZAF.AF

4163. TNC with CWID needed - which is cheapest?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-09-15 00:00:00 UTC
From: jwittich@b4pph107.bnr.ca
Message-ID: <43c2sh$s5b@crchh327.rich.bnr.ca>
Source record: 41300

Hi everybody. I need a TNC that can do automatic CW identification. What is the cheapest one with this feature? I have checked the MFJ 1270 and 1274, and they do not have the feature. The KPC 9612 does, but it a about $200 of so.

I plan to use it for some low power experimenting on a simplex frequency. I will NOT be doing CW IDs on packet freqs.

Thanks.

73, Jeff - AC4ZO

The Kantronics KPC-3 has a CW ID feature and goes for about $119 U.S.

4167. MSK = Minimum Shift Keying

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-09-15 00:00:00 UTC
From: ranecurl@engin.umich.edu
Message-ID: <43b7m7$sue@srvr1.engin.umich.edu>
Source record: 41304

MSK is the mode used for transmitting the differential corrections
in order to remove SA error in GPS position measurements. I inquired
in sci.geo.satellite-nav about whether anyone has adapted ham
equipment to receive and translate this mode, but got no response.
Can anyone direct me to published information on amateur use of
MSK in digital communication (or, even better, for GPS!)?

>converted to this mode. Of course we are looking at inexpensive and
>reliable radios.

You want the Tekk KS-900. It's designed for 9600 baud data, and it's cheap.
Or you can use the Kantronics D4-10. It's also designed for 9600 baud data,
but not quite so cheap. Or you can butcher an old Micor or Mitrek, though
opening up the IF bandwidth is not trivial if you want good performance.

QST says that of the Japanese radios you want an all-mode since
they usually avoid the synthesizer loop bandpass problem by
modulating an IF stage. They also raved about a new, and expensive,
Azden that's designed for 9600 baud data and FM voice.

Most of the Japanese radios advertised as "9600 baud ready", aren't.
That's just advertising copy, not engineering. It usually means they
put a jack on the back labeled "data", but didn't do any of the
bandpass modifications necessary to properly handle 9600 baud, IE
phase linearity sucks. A case in point is the Kenwood 733. While many
have tried to use them at 9600 baud, the BER is disappointing. And QST
gagged over a couple of Icom models too.

You want a direct FM radio, preferably crystal controlled or IF
modulated, with a receiver IF filter that's gentle and fairly
broad in order to have a reasonable phase response. IF filters
generally suffer severe phase linearity problems near their edges,
so you need a filter that's broader than the modulation would indicate
in order to stay near the filter center and avoid the phase errors
out at the edges. A 30 kHz bandpass seems to work well for 9600 baud.

Unfortunately, SNR and adjacent channel rejection suffer with the broad
gently sloped filters, so you'll need more than expected signal strength,
and a greater guard band, in order to get through with a low BER. This
is a result of the decisions made for the modulating signal in order
to use it through voice grade FM radios. There are much better modulation
forms that could be used with purpose built radios. An example is the
MSK used with the 56kb RF modem. More nearly ideal filters can be used
with this modulation than with the K9NG/G3RUH modulation, but voice
grade FM radios can't be used with MSK so you need purpose built
data radios.

Interestingly, QST found that *overdeviating* the voice grade radios often resulted in lower BER at 9600 baud. This is contrary to the experience with 1200 baud where low deviations generally work best, IE 3 kHz instead of 5 kHz works better for 1200 baud. It may be that a form of limiting occurs in the non-linear IF filters of voice grade radios with hot 9600 baud modulation which sidesteps some of the phase linearity problem. If you try this, watch total occupied spectrum, however, to make sure you stay within the limits for the band you are using, IE don't try this at 2 meters.

4169. Part 15 Equipment For Packet Networking

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-09-15 00:00:00 UTC
From: Rick Whiting <rwhiting@winternet.com>
Message-ID: <43cvu9$flv@blackice.winternet.com>
Source record: 41306

Has anyone used unlicensed (Part 15) equipment as part of their packet radio network?

I'm looking at some vendor's descriptions of Part 15 WAN radios that look like they might be useful as a high-speed backbone (MAN) network. I note that both direct sequence and frequency hopping technology is used. Is one to be preferred over the other (in the currently marketed equipment)? Does it depend on whether you're at 900 MHz vs. 2.4 GHz?

Comments suggestioned solicited. Thanks.

73/Rick W0TN

This message describes the rec.radio.amateur.*, rec.radio.cb,
rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet
mailing list counterparts and complements. It is intended to serve as a
guide for the new reader on what to find where. Questions and comments may
be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@admin5.hsc.uth.tmc.edu. This message was last changed on 31 October
1994 to add the discussion of non-Usenet mailing lists and streamline most
of the history discussion, and to change the moderator information for
rec.radio.info.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became
progressively higher. First one by one, and then as part of two
reorganizations, what was once one group became many. In the process,
developments elsewhere on the net were reflected in the groups as they were
created, most notably the change to place all of the ham radio groups in one
hierarchy.

The collection of newsgroups continues to grow as more people join the net,
and as more topics of discussion gain volume, I expect to see more groups be
created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the
notable exception being rec.radio.swap. There are also a few mailing lists
that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them,
and not to the groups that aren't. The whole idea of having different
```

newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

All of the following mailing lists are sponsored to the Boston Amateur Radio Club, as well as some others of local interest. Thanks to N1IST for the information.

qrp-l: This is the qrp mailing list, previously maintained by Bruce Walker at Think.com. It is for discussions about the design, construction, and use of qrp (low power) radios and related equipment.
arrl-ve-list: This is a one-way list, run by Bart Jahnke of the ARRL VEC, for announcements to VEs and VE teams.
w1aw-list: ARRL bulletins, news, and information
newsline-list: Redistribution of Amateur Radio Newsline
letter-list: Redistribution of the ARRL Letter
fox-list: Fox hunting and Radio Direction Finding
fieldorg-l: ARRL field organization discussions
ham-tech: Technical discussions and questions about Amateur Radio
arrl-exam-list: amateur radio license examinations scheduled in the US and in some foreign areas.

To sign up or inquire about these lists, send mail to listserv@netcom.com with the following in the body (subject is ignored) of the message.
<listname> is the name of the list to subscribe to.
To subscribe: subscribe <listname>
To unsubscribe: unsubscribe <listname>
For more information: help
To post (to the two-way lists), send your message to <listname>@netcom.com

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

You have been registered and are now able to utilize the gateway.
Please review the instructions and keep a copy handy. If you have
questions please direct them to me directly as
"bob@arasmith.com".
good luck
bob

N0ARY/BBS Internet Gateway Operating Instructions
August 26, 1994

LOCAL USERS:

Local users are those that log into the bbs via the bbs's
telephone modem port (408-749-1950) or via one of the 3 tnc ports
(144.93, 223.62, 433.37). Each local user has a bbs account that
is used to customize how the bbs interacts with the user.
Local users can set their account up so that all incoming mail
addressed to their call will be forwarded via a gateway to
internet and on to other networks (mcimail, compuserve, etc). All
the user needs to do is enter his email address and turn the
feature on.

EMAIL bob@hal.com
EMAIL ON

When the EMAIL feature is turned on the packet message will be
deleted at the time of forwarding through the gateway. So care
should be taken that the paths are correct prior to turning the
feature on, for instance enable it, send a test message, and
disable it. After a successful transfer re-enable the feature. To

disable the auto forwarding feature simply type:

EMAIL OFF

Messages can be sent by packet users to the internet users via the gateway. This applies to users at N0ARY as well as users at other bbs's. Begin by sending a message to IPGATE@N0ARY with the first line of the message being the letters "To:" followed by the internet address of the recipient.

N6ZFJ de N0ARY >
sp ipgate@n0ary
Enter your subject:
Meeting?
Enter your message body:
To: bob@hal.com
Are you planning to attend the club meeting on Thursday? Give me a call. 73, Connie
^Z

NOTE: That the recipient cannot respond to the message unless they are a ham and registered with the gateway. He/she becomes registered by sending a message from his internet host to gateway-request@arasmith.com.

REMOTE USERS:

Remote users are those that do not log into N0ARY directly but merely appear from the packet world to use it as home. If a packet user checks the "White Pages" for a remote user the entry comes back as @N0ARY. The packet user then address his message to YOURCALL@N0ARY and the bbs will do the translation and forwarding to internet.
It is not necessary for a person to know your actual internet address nor use the SP IPGATE method described above. From the packet network it appears that you are just another user at N0ARY.

WHITE PAGES:

The "White Pages" is a distributed database of all the bbs users. Most bbs users in the US are represented in the database as well as many from other countries. When a user chooses a home bbs, that bbs generates an update that is sent to the regional servers and then distributed to all the other bbs's. An entry consists of; call, home bbs, first name, zip, city and state. When a user wishes to send another packet user a message he/she consults the white pages (WP) for the home bbs.

REGISTERING:

Before a user, both local and remote, can send a message from

internet into the bbs system he/she must register with the
gateway.
This is done by sending a message from the host that he/she
intends to use to gateway-request@arasmith.com with the following
information:

CALL:
FULL NAME:
CITY & ST:
ZIP:
HOMEBBS: (if you have one, if left blank mine will be used)
PHONE:

When a request is received the "From" field is copied directly
into a file with the requesters call. Whenever the gateway
receives a message bound for packet it scans this file comparing
on the "From" field. When a match is found the gateway uses the
associated call from then on. If there is no match the mailer
bounces the message with a one-liner indicating the user must
register.
If you currently use another bbs as home this needs to be stated
in the request. Otherwise you will be assigned N0ARY as your
home.
If you choose not to use N0ARY as your home you must make sure
people know to send your message to YOURCALL@N0ARY to pass
through the gate. Your WP entry will be wrong.
NOTE:
Registering is a manual process on my end. So don't attempt to
send mail through the gateway until you receive a confirmation
message from me. Normally this takes less than a couple hours. Of
course if I am on vacation it could be longer.

EXECUTING BBS COMMANDS REMOTELY:

Many of the commands available to local users is also available
to remote users by sending a message to the bbs. Here is a subset
of the commands currently available.

LIST listing messages
LOOKUP look up calls in the on-line callbook
WHO call dump a users account information
READ read messages and files
USERS n display the last n users to connect to the bbs
INFO display manual pages of various topics
CD change directories in the file system
LS/DIR display the contents of a directory
WP call look a user up in the "White Pages"
HELP get help on how to use a command

Not all commands available to local users can be accessed via the
gate. All interactive commands are disabled as well as commands
that modify the users account.

The command parser for the bbs is very powerful and the user can form very complex requests. For instance the following command is valid on the bbs:

```
LIST LAST 20 BULLETINS FROM N0ARY
LIST ALL BULLETINS ABOUT KENWOOD
```

The ABOUT keyword is used to search the subjects of messages for a given pattern, in this case KENWOOD. It can appear anywhere in the subject line.
This is an example of how complex all the commands can become. They can also be abbreviated down to the level understood my most other bbs programs. Any of the following will give the same results.

```
L< N6ZFJ
LIST FROM N6ZFJ
LIS < N6ZFJ
L FR N6ZFJ
```

In most cases a minimum number of unique characters is needed to distinguish a command.
You can get a list of commands and a translation chart from W0RLI to N0ARY by typing the following commands.

```
INFO COMMANDS
INFO W0RLI
```

Other commands that you may wish to execute are:

```
INFO MANUAL
HELP HELP
HELP LIST
```

Now that you know what some of the commands are this is how you go about executing them. You send a message to cmd@bbs.arasmith.com with your commands entered one per line or separated by semicolons.
For example if you want to know if three of your buddies are in the white pages and if the bbs has any messages about the ICOM W2A.

```
Send to:
cmd@bbs.arasmith.com

Subject: you can put anything here
wp n0ary n6zfj n6une
list all about w2a
.
```

The bbs will execute the commands and respond to you via return mail.

SENDING MAIL TO PACKET:

Once registered the user is free to begin using the gateway to send messages from his host through the gateway into the packet world. How much you have to specify of a users address depends on how much the bbs already knows about the user.
If the bbs knows the home bbs of the user and his home bbs is know to the N0ARY bbs, which most of them are, you simply need to supply the call.

n6zjf@bbs.arasmith.com

If the N0ARY bbs doesn't know of the user but does know where his home bbs is then you need to supply just the home bbs call in addition to the users.

n6zjf%n6qmy@bbs.arasmith.com

Notice that the call and home bbs are separated by a percent sign '%' rather then the '@' which is used in the packet domain. This is because the '@' has a meaning in the internet address.

If the bbs has no knowledge of either the user or his home bbs then you probably have the wrong home bbs or it is a new bbs. In which case you will have to supply the full address so the bbs will know how to route the message.

n6zfj%n6qmy.#nocal.ca.usa.na@bbs.arasmith.com

This level of addressing is hardly ever needed and normally means that the home bbs is in error. Bulletins can be sent in a similar fashion. The address is made up of a keyword, which can be any six character word and a distribution. Distributions are local to an area. For instance SBAY is valid in northern CA, it probably has no meaning at all in Topeka, KS.

Valid distributions are:
ALLUS please avoid this one
ALLUSW all western US
ALLCA all California, any 2 letter state
should work
So if you trying to find a cw filter for a Kenwood TS440.
Send to:
want%allca@bbs.arasmith.com

Subject: Kenwood TS440, CW filter
If you have one of these you are willing to part with please give me a call or leave message, thanks.
73, N6ZFJ@N0ARY.#NOCAL.CA.USA.NA
.

Be descriptive, brief, and always include your full return address in the message. Also please try to limit your distributions to small regions. Using the ALLUS distribution

really slows down the flow of messages.

INFO ON THE N0ARY BBS:

The bbs came into being in July of 1990 and as of Aug of 1994 had over 1200 active users. The bbs has 3 rf ports, 2 phone ports, the internet port, and a voice synthesizer port. The latter allows users to check for messages via DTMF from their handhelds. The bbs itself runs on a Sun workstation under Unix. The code was written by Bob Arasmith to focus on the user. Great care was taken to make the bbs very forgiving to the novice user but very flexible and powerful for the old-timer. The bbs can be configured to interact with each user differently. Some examples are:

* List messages in either descending or ascending order.

* Specify a list of keywords that the user wishes not to see displayed when a list is performed, similar to a kill file.

* .signature and .vacation files.

* Specify how many lines the users terminal is capable of displaying before scrolling, the bbs will feed info this many lines and pause allowing the user to catch up and continue or abort the operation. Similar to more.

* Users can put commonly executed commands in keystroke macros that are accessible via a single keystroke.

A manual is currently available describing the commands and their permutations. This manual will be available in late 1992 as a postscript file. Run the command INFO MANUAL to learn how to get one via the post office. It is not available in an ascii format.

If you have any questions about the internet gateway or the bbs in general please drop me a message.

If its winpkt.com, which basically replaces winsock.dll for users of trumpet, you can find it bundled with version 2.0b (that I know, not sure of the newer ones) thats avaiable anywhere. Look for TWSK20B.ZIP. Tis what I use in combination with ethrax25 to do web browesing etc via packet radio.

I'd be interested, but I wonder if there is an easier way to ragchew on Pactor with a KAM? The Hostmaster II+ software is pretty klunky in that respect. If you're in the listening mode you can't transmit and if you're in the transmit mode you can't listen. Anybody have a solution??

Before you do that, get a tool like Graphics Workshop and either reduce the resolution/color range if possible to make a smaller GIF *or* or convert it to JPEG format. GIF's are big and UU'd GIF's are even bigger. Could easily choke a packet network.

Yes. UUEncode works fine as long as the recipient knows what uudecode is.
Why did you ask? Why not "just try it"?

The Mac-specific BinHex format also works well. Yet the serious binary PC
packet emailers seem to have standardized on "7plus" as it makes things
easier to split in sections small enough to email. Easy enough that some
PBBS's are swamped with 7plus encoded messages.

73,

In a message dated 95-09-17 21:27:18 EDT, you write:

>
>And how did you come to be the... what was it -- "Vertical Skywave
Girl"??
>
>

Early in 1988, I started doing experiments with what was called "Near
Vertical Incedence Skywave" or "NVIS" for short...

NVIS - is the use of HF radio antennas that are placed parallel to the
ground
and as close to the ground as possible to limit ground-wave generation.
NVIS
utilizes single-hop F-Layer propagation through directing the RF from your
station in a straight-up path. Proper choice of Frequency can be critical
-
it is important to operate near what is called "Critical Frequency" or the
highest radio frequency that will still refract back down from the zenith.
If
you operate to low below critical frequency, then
the results are excessive D-Layer absorbtion of your signal and excessive
multi-path
distortion which can be a problem for HF Data modes..

During the vietnam war in the late 1960's, the army tried different
techniques to attempt to use hf radio more effectively for operations that
were larger in scope than what typical ground-wave could be used for. The
ranges needed were from 0 to 400 miles typically and were in support of
covert ops in Laos and Thailand. It was found the vehicles using HF radios
would have significantly better results if their mobile antennas were
parallel to the ground instead of vertical. To communicate with base

stations, base station antennas also needed to be horizontally polarized through the use of the standard horizontal dipole or variations of same. Limiting ground-wave generation also reduced the enemy unit's capability for
direction-findinig on the station as the received signal was from almost directly overhead.

Lt. Col David Fiedler of the National Guard of New Jersey published the results of a series of studies in issues of "Army Communicator" magazine. Lt.
Col Fiedler found great resistance from the U.S. Army in adopting the NVIS concept even though initial work done during the Vietnam war both by army units and by Stanford Research Institute (SRI) showed the NVIS was a valid HF
radio concept. I publicised the NVIS work of Lt. Col Fiedler at various Amateur Radio club meetings and conventions in norther california during the
time frame of 1990-1993 ..

The Moniker "Vertical Skywave Girl" was given to me by none other than Gordon
West, WB6NOA after he wrote some articles regarding my work..

for further info on NVIS >> see the January 1995 issue of QST Magazine by Ed
Farmer
who did an excellent write up on the subject..

>
>L Ward
>KO4IQ

Howdy:

UUENCODE has major flaws when it comes to error correction.
It doesn't have any! 7PLUS was developed to correct the most common
errors encountered when messages are sent over the packet network.
Contrary to popular belief packet is not error free. The errors usually
occur between the tnc and computer when a overrun occurs and changes
one or more bits. 7plus can correct this without requesting a
correction message from the originating sender. If a whole byte or more
is trashed, 7plus will create a correction that you can send back to
the originator of that message. His 7plus will take that request and
reply with the minimal data nessesary to fill the "hole". This can all
be automated with several servers that are available. That's why you
see many more 7plus bulletins than any other type carrying binary
files over packet.

geoffm@pcug.org.au

Mark

I am using the Hamcom software/converter combination for receive only.

Works OK on good CW, and OK on RTTY and AMTOR.

CW conversion is patchy and depends on the quality (i.e. even-ness) of
the sender.

Hope that helps

The latest (1.1.9) TAPR TNC-2 release supports an FSK CWID, as do recent
1270s and 1274s.

From: paulgren@myhost.subdomain.domain
Message-ID: <43jmg2$dp9@silver.starway.net.au>
Source record: 41329

My interest is the digital protocols on H.F, as an SWLer, using homebrew hardware and software and I continue to struggle with PC RFI. My receiver, valve, is well shielded, BNC antenna input.

Sofar I'm using a balanced feedline and balun from a dipole, I've disconnected house earths and am using a couple of meters of copper bus-bar driven into damp ground as an RF earth, I've sprayed around the inside of my VGA monitor with electro-conductive (nickel-based) paint, I've got aluminium foil inside the monitor case, I've tried a Monochrome monitor, I've put toroids on PC signal leads, I've installed an FCC approved PC power supply, all audio and signal leads are in coax, I've ...

While the monitor case paint had the most significant effect, my PC RFI problems persist with me not be able to do any digital SWLing above about 10MHz. At lower freqs, signal levels have to be pretty good to be able to demodulate/decode. Any more suggestions please ??

If you are planning to use this equipment as part of an AMATEUR Part 97
network, you must comply with the amateur rules restrictions regarding
frequencies, bandwidth, frequencies, SS spreading codes, and plaintext.
Now have at it.

4198. NVIS 80 Meter Pactor ops (was Calif pactor ops)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-09-20 00:00:00 UTC
From: wa6ube@aol.com
Message-ID: <43o7de$85l@newsbf02.news.aol.com>
Source record: 41335

For those interested in using NVIS antennas and 80 meter pactor, a group
is starting to form and be active on the 80 meter band. The following hams
are
now active: KI7GF - Larry; NF7V- Jack; WB6HQK-Bart; and WA6UBE - Trish;

Current freq for initial calling and access to another user's
mailbox is: 3633 (mark tone)
Tentative freq for long-winded qso's that are
keyboard-to-keyboard is: 3637 (mark tone) ..

---
part of this effort is for a group of hams to move away from the practice
of just
getting on to a randomly selected frequency, calling cq, and hoping that
someone who is tuning around the band will happen to tune across and hear
their cq.

I have set up my kam unit as follows: mark tone= 1000 Hz; space tone=1170
Hz
shift = Modem.

This way your radio's frequency display will be showing 3634 KHz when you
are
on the calling channel and 3638 khz when on the keyboard-to-keyboard
channel
since your mark tone will be 1000 hz below your displayed frequency when
the
equipment is set up properly.

Actually, that's not true. You can use Part 15 devices *under Part 15*
to interconnect disjoint amateur segments of a network operating under
Part 97 just as you could use telco links for the same purpose. You'd
only have a problem if you modified the Part 15 device so that it no
longer falls under Part 15, IE by using an amplifier for example. *Then*
you'd have to obey Part 97 rules when applying it just as you would for
any other commercial service radio you'd modified for use in the amateur
bands.

Paul, it sounds like you've been heading in the right direction, however, you obviously haven't gone far enough in some direction to solve the problem. What you need is a systematic approach. You need to locate the sources of interference one at a time and suppress them one at a time until you've quieted the entire system.

Here is an approach to try. Disconnect everything from the PC except the power cord. Power it up and hunt for interference in your receiver. If you still find interference, it's getting through the case, or coming out the power lead. So take steps to improve case bonding, or use better RFI suppression on the power lead (right at the case) until you've quieted that RFI source completely. Next add the keyboard. Do what is necessary to quiet that. Then add a mouse, if you use one, and quiet that, finally add your monitor, your printer, your modem, etc, one at a time and similarly suppress each. You'll chase your tail for months trying to quiet the system by shotgun methods. You've got to be systematic and treat one problem at a time.

If you find one item that's particularly noisy, and you aren't having much success in quieting it, come back here with details and we'll give you specific advice. You *can* quiet any computer, it just depends on how much effort you want to exert doing it.

Your best bet would be to put the two TheNET TNCs on a diode matrix, along with a third one (running TheNET also) just for the cluster. Connect the cluster TNC to a normal, regular TNC (via wires to the modem disconnect header) that is connected to the computer, and forget BPQ.

Alternatively, again put the two TheNET TNCs on a diode matrix, and configure BPQ to speak directly to the diode matrix (it does this easily), thus saving a TNC. Be careful, though, if BPQ crashes, or the computer is off,no data will flow on the matrix.

If you need more details on how to do this, write to me at 73227.2644@compuserve.com

Source record: 41342

Two things I'd check:
(1) On all my PC's when the radio is turned on without the
Baycom software up and running, on the CORRECT serial port,
the radio is keyed up transmitting a dead carrier.

(2) I am not familiar with the ICOM T1 but the 2AT etc
series uses a 2-wire microphone configuration that has both
TX audio and PTT on the same center conductor; it requires
a resistor/capacitor splitter combination to separate the 2
signals for the modem to work with the radio:

```
PTT from Baycom modem-----------||-----|
.1 Uf |
0------ Microphone
| Center cond.
10K res. |
TX Audio from Baycom modem----/\/\/\---|

Modem Ground---------------------------------Radio Ground
```

Maybe this hookup will help.

From: ppiercey@nlnet.nf.ca
Message-ID: <43qk1k$al6@coranto.ucs.mun.ca>
Source record: 41344

I am running a 4 port FBB BBS with the TNCs in host-mode (for now) and would like to know if there is a way to run the gateway between 2 of the ports and not allowing access to the other two. The reason being that the ports I want to exclude are forwarding ports. There are two user freqs that I would like to connect but when I start the gateway, they all come up active.

This is a temporary measure as I plan on running BPQ as soon as I get enough memory (not me, the computer :)).

Also, I would like to know if the gateway permissions can be user specific, such as allowing the sysop access to all ports and the typical users access to the user ports only. Please EMail any info that could help directly to me as I may miss it through this group. Thanks.

Since I am very confused about which radio can and which can not
directly support 9600 packet, I'd like to ask the experienced guys
here.
Which radio (I mean mobile mostly) can DIRECTLY support >=9600 packet?
I've been told about FT8500 and about TM733 but noone have the
necessary experience arround here.

Thanks in advance.

MIX version 2.19

HAMWARE from
Nick Fedoseev
(UT2UZ, ex RT4UZ)

Copyright (c) 1992-1994

Mail address: P.O.Box 3, Kiev 89, 253089, Ukraine
FIDO address: 2:463/65.71, 2:463/173.71
PACKET address: UT2UZ@UT2UZ.KIV.UKR.EU
-------------------------------------------------

Running MIX
-----------

Just type on the DOS PROMPT (or prepare the suitable batch file as MX.BAT).

Possible switch meaning

/cCALL CALL is your HAM-call
/qQTH QTH - your city
/nName Name - your name
/oOperator This is used in field OP of LOG.DBF file
(for club station).
/lLOCATOR LOCATOR - your WW locator
/iINITMACRO INITMACRO - name of file consist of your macros
/tHoursToUTC Difference between your computer clocks and UTC
in hours (may be value with decimal point)
/fFqTX FqTX - Central frequency of TX (Hz) 1700 default
/rFqRX FqRX - Central frequency of RX (Hz) 1700 default
/S Use SnowChecking for CGA adaptors
/U Use ContestTime HHMM format (HH:MM default)
/A Use external keying (like BAYCOM)
/B Use external decoder (like BAYCOM)
/1 Use COM1 port (COM2 default)
/8 Use Font 8x8 for EGA and VGA monitors
/z Use Com-Sound interface (see HARDWARE)

You can also modify the mix.ini file to change some params. This file may
be deleted if default values are desired.

Keys list
---------

F1 - HELP (press now) Ctrl+A Select mode ScrLk Quick speed select
F2 - SAVE RX buffer Ctrl+B Insert break
```

F3 - Load TX buffer Ctrl+C Clear RX buf Home Set RTTY 45 mode
F4 - Use LoCase/Upcase Ctrl+E Edit file TAB Switch TX/RX
F5 - Add QSO to LOG Ctrl+F Select band Ctrl+PgUp, Ctrl+PgDn

- 2 -

F6 - Spell last word Ctrl+N Toggle Negative change mode;
F7 - View/modify LOG Ctrl+O Clear ALL Ctrl+left, Ctrl+right
F8 - DOS command Ctrl+Y Clear TX buffer change band;
F9 - repeat last line Ctrl+R Select table Alt+A.. Alt+Z Use macro
F10- repeat last word Ctrl+S Select speed PgDn Change testnumber
Ctrl+J RX-buffer PgUp (cell #9)
Shift F1..F10 Get word Ctrl+K TX-buffer
Ctrl F1..F10 Edit word Ctrl+Z Beacon mode Ctrl+Q Set AutoRepeat
Alt F1..F10 Put word Ctrl+D Send timestamp
Ctrl+G - switch noice filter
Ins - check country Ctrl+V - RTTY MailBox Esc, Y - Exit

Transmitting

All letters you have pressing are stored in TX buffer and will send to
air after pressing TAB. You can add previously prepared texts from the disk
to TX buffer by pressing key F3 and typing the name of file to be
transmitted. The second way is to use the macros by pressing ALT+A..ALT+Z.
Use /i switch to load prepared macros. You can repeat last string/word by
pressing F9/F10. You can spell last word by pressing F6. Use Alt+F1..Alt+F10
to add the word from the second line of the main screen. Use F9 to repeat
last line and F10 to repeat last word. Use Ctrl+B to mark the end of
transmission.
Up to 60 lines of just transmitted text you can select (for
retrnsmission) by pressing Ctrl-K. Use arrow keys, then press ENTER or F9.

RTTY MailBoX

To run this mailbox, correct files, listed below and add to the current
directory your own messages. Their extension must be ".MSG". Than press
Ctrl/V. The commands currently available for external users listed in the
"HELP.MSG" file. Type Esc twice to stop mailbox.

HOSTBEAC.MIX - Message to send as HOST-BEACON.
HOSTPROM.MIX - Message to send as HOST-PROMPT.
USERS.MSG - USERS LIST. Can be corrected if too big.
LASTUSER.MSG - Last USERS LIST.

Receiving

You can receive the text using one of three code-tables available: ITA,
USA and RUSSIAN standards. Press Ctrl+R to switch current table. You must
install russian table for your screen before running MIX to use RUSSIAN
standard.
Received words are stored to special buffers (up to 20 words). You can

press Shift-F1 to put one of previous words received into the first cell.
Press arrow keys to select desired word. Than press ENTER and see the second
line of the main screen. The same is for other cells (use
Shift-F2..Shift-F10). You can modify the content of any cell by pressing
Ctrl+F1 .. Ctrl+F10.
There are the simple HAM-calls filter for the first cell and RST-filter
for the second one.
You can store the QSO buffer to disk by pressing F2. This buffer stores
both transmitted and received texts. Press Ctrl+C to clear this buffer.

- 3 -

Up to 60 lines of just received text you can select (for replay) by
pressing Ctrl-K. Use arrow keys, then press ENTER or F9.

Notes on PACKET (AX25) receiving

The first cell (CALL) is used for filtering packets. If you have
"la2b-2" in this cell, you will read packets from la2b-2 only. Press
<Ctrl>+O to clear all cells if you want to read all packets. Press
<Shift>+<F1> to see the list of received packet stations.
Transmiting is not available in the current version.

Using the database LOGBOOK

The contents of second line of main screen will be written into the
dBase-IV format to file LOG.DBF which may consist of fields:

FIELD TYPE LENGTH REMARKS

DATE Date 8 DBase format
TIME Character 4 HHMM format
BAND Character 4 (MHz)
M Character 1 Mode R-RTTY, E-FEC, C-CW

The best bet, if you can still find them, is the DSK - Designers' Starter Kit, which was about a hundred or less USD. Has the onboard stuff you need, much of the work the folks have been doing has been ported to it, and it's a breeze to get up and running.

Johan Forrer at Oregon State has done some of this, and it worked just fine in my DSK.

By the way, I also got a package by Otkay Alkin, PC-DSP [there is a later version] that lets a novice like me create somehting that I can visualize [a filter?], and turn it into coefficients for dsp [the TI ones] that will also run on the dsk. Great.

It cost me about 40 USD.

Anyone update this ifo?
/mark

Aside from the purpose built data radios like the TEKK and the
Kantronics D4-10, only the Azden PCS-9600 voice/data radio is
ready to go right out of the box. According to QST test results,
the radios you mention aren't *really* 9600 ready, and local
experience backs that up. Their 9600 baud capability is primarily
a development of the advertising department rather than the
engineering department. QST did look favorably on some of the
all-mode rigs, like the IC-820H, but most synthesized FM rigs
fail miserably at 9600 baud. Both the Azden and the IC-820H
do their modulation at a fixed IF *outside* the synthesizer
loop, and both the TEKK and the Kantronics D4-10 are crystal
controlled. That should be a clue as to what kinds of radios
to be looking for. If the modulation is applied inside the
synthesizer loop, you've got trouble on your hands.

Greetings to all:

I would like to know if there is any software available so that I can run a BBS configuration so that the P38 would be used on a number of scanned frequencies on the HF bands, in the Clover/Pactor/Amtor modes (in decreasing priority) and with a VHF packet port, running something like a PK88, that can access the BBS remotely. The preference would be W0RLI compatible on the VHF side.

In advance, thanks for any replies.

73 and live better digitally

The British Amateur Radio Teledata Group caters for RTTY, packet, AMTOR and in fact just about every data comms mode in amateur use. Unfortunately, though we do have USA members we are mostly to be found over here in the UK and couldn't offer you immediate help - we'd always be at the far end of an Internet link.

Try our fellow group over in the USA - the International Digital Radio Association.
A useful initial contact would be

Jim N2HOS at 71573.1077@compuserve.com

and their Web pages are at

http://www.iea.com/~adrs/

By the way, the BARTG pages are at

http://cs.nott.ac.uk/~ibx/BARTG/

The DSKs are great, and if you aren't wedded to the TMS series,
Analog Devices has a great EZkit for their ADSP-2100 series that
I've been using. The Cardinal sound card also uses the Analog
Devices chip, and there are development tools available for it.
Back with TMS chips, I found an IBM brand sound card (actually
made by Tecmar), IBM P/N 92F3378, in the surplus channel that
uses the TMS320C25 at a 40 MHz clock. There is shared memory
with the host, and a bidirectional interrupt structure, making
a tightly coupled DSP system simple to implement.

4223. 2Mbps datalink questions

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-09-22 00:00:00 UTC
From: ccrv@glue.umd.edu
Message-ID: <43topj$fr2@mojo.eng.umd.edu>
Source record: 41360

I read the ARRL Handbook/Ham Radio Magazine article on the 2Mbps data link, and it left me with a number of questions, so here goes:

1) What quality of Gunn diode is neccessary? I was recently at a hamfest, and someone was selling X-band "brake light testers", for about $20. I asked if he was familiar with the datalink described in the handbook and if his devices would work. He replied yes to both questions. I questioned him further and he did seem to know what he was talking about, but the fact that he was the one actually profitting off the sale made me leary. Would a cheap little 1-2 cubic inch diode with a bunch of terminals suffice?

2) What is the maximum speed of the link? The article works with a 2Mbps link, but seems to indicate that higher speeds are not undoable. From what I gather you can increase the speed to about 4Mbps without any changes to the design or quality of components. Does this sound about right?

3) How exactly is the device interfaced? The article describes a device called "MAU" which I believe is Arcnet, however, I'm not sure how easy it would be to provide software for Arcnet cards. Another idea which seems to me might actually be practical is to take an Ethernet card, and replace the 20MHz crystal with an 8MHz crystal (if I want 4Mbps). I have talked to a number of people who seem to think this idea is feasible, although none wanted to say it would definately work. At that point, I would think it would be fairly easy to interface the device to a 4bT Ethernet card. Any opinions?

Are there any easier/cheaper solutions to the ideas presented above?

I have a hankering to make my paket station go for a walk. Does anyone know the wiring requirements for the th28a and/or the th78a to the KPC3?

I have not called kantronics yet, because as a ham I'm cheap and don't want to spend the long distance dollars. I also suspect this group would be more likely to give me excellent information.

Thanks for any replies, I would appreciate an email if you could...

> cubic inch diode with a bunch of terminals suffice?

You were right to be suspicious, IMHO the brake light tester won't
work for this application. The ones I've seen use a transistor oscillator
and a multiplier diode to generate the signal (and all it's harmonics).
This is just an RF noise generator. The MAComm gunplexers will work, and
some of the Sofan type burglar alarm units can work (and I believe is
what was used in the article), though I understand that they have problems
if you try to push their speed. That's because the the Sofans don't have a
separate modulation diode and you just push the supply voltage to the Gunn
diode to modulate it. The slew rate of the regulator limits how fast you
can push this method. With the separate modulator diode in the MAComm,
you can do FM video, so I expect high speed data will not be a problem.

I can't say. The MAComm units should be able to do 10Mps. They'll handle
video rates.

> Any opinions?

MAU is Media Access Unit, and is used with ethernet cards that drive thicknet. It goes between the 15 pin connector on the card and the RG-8 type thicknet cabling. As to slowing down an ethernet card by changing crystals, I don't know if that will work. It sounds plausible, but there may be a flaw in the plan somewhere.

4231. Need advise/Refs for simple Transmitter

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-09-22 00:00:00 UTC
From: mikew@csh.rit.edu
Message-ID: <MGMEKC.BqFD@csh-newsserver.csh.rit.edu>
Source record: 41368

Hello All,

I am working on a project which (under ideal circumstances) would
require communication of two small devices over the air for a maximum of
40 Yards. The desired bandwidth I'd like to have is about 60 Bytes (480 bits)
per second. The lower the error rate the better, but I can tolerate some
(the "packets" have error correction data in them by design).

I haven't ever built an antenna/receiver system, though being
and EE understand how they work. I'm thinking that a simple AM modulator
should work. Would anyone with some practical experience be able
to point me to a simple antenna example I might be able to work with? And,
for that matter, are my specs unreasonable for a "home brew" type
antenna/modulator?

Could it be as simple as a carfully selected length of wire?

As a project, I'm going to live a year in the wilderness in the vast mountains of Norway. I'm trying to get a computer- and Internet based communication. So my question is: What is the best equipment to choose for the connection? I'm experienced in computer, but unfortunately not in digital radioing.

The distanace from my hut to the nearest Internet wire is about 100 km, with fairly mountainous terrain, and I hope to get a fairly good connection. (56 kbps and up). So please tell me: Is this a hopeless project, or not? And what equipment should I use?

<< I am working on a project which (under ideal circumstances) would require communication of two small devices over the air for a maximum of 40 Yards. >>

What frequency band did you have in mind??

Is this primariliy an exercise in building your own transmitters/receivers? or
have you thought of the use of alternatives in "already built" gear for the range and
speed that you need? for example some types of low cost military telemetry
equipment like AN/PRT-4 with its companion receiver unit. OR army surplus PSID units (Patrol Seismic intrusion device) .. There are surplus PSID units that
work up in the 140 MHz range and are low power A.M. devices -- Sources would be "Fair Radio sales" in Lima Ohio p.o. box 1105 45802.

>I read the ARRL Handbook/Ham Radio Magazine article on the 2Mbps data link,
>and it left me with a number of questions, so here goes:

>1) What quality of Gunn diode is neccessary?

You need a Gunnplexor. That is, a cavity with both a Gunn diode and a
Varactor inside. The Modulation of the DC power is a poor way to go.

>2) What is the maximum speed of the link?

As fast as your data pump can go. A good data pump is the PI2 card, and
an ethernet card.

>3) How exactly is the device interfaced?

You need a shielded cable that has low noise, differential line drivers,
etc.

>Are there any easier/cheaper solutions to the ideas presented above?

All high speed choices are expensive. There is a market for an integrated
data pump and RF link. The big companies have gone the spread spectrum
route. They do so because of less interference. The Gunnplexor uses a
crystal diode as a detector, rather than a superheterodyne mixer. It is
highly prone to interference. A nearby radar will zap it every six seconds
or so. For example when I take my Gunn radar by the FAA Academy it has a
real nice BZZZZZZZT as the Approach radar swings by. The approach radar is
L band, and my radar is X band. The crystal detector of course is the culprit.

Might I suggest "PacketPeT For Windows". It is a full featured
product written in high performance C language (unlike other
products written in Visual Basic or Toolbook...), and is in
it's forth year of development. The most recent version is 2.1,
and the shareware release PacketPeT Lite can be obtained on
CIS, AOL, and at various net sights such as ftp.qrz.com..

Most hardware TNCs are supported, and the KPC3 is on the list.
Rather than brag on it's features, I will just let you download
it and give it a test drive. Keep in mind the Lite version does
not have all of the features of the full version, and that
further improvements are currently being developed / tested.

That is a good question. Perhaps someone with some experience, e.g.,
using the Symbol Technologies, Telxon, or Tetherless Access, etc.,
wireless WAN/LAN equipment, will enlighten us.

>Very expensive. I have hear rumors about the AT&T Wavelan cards being

Expensive relative to what? Putting in a full-duplex 56K repeater, etc.,
also costs a few bucks.

Peak output power can be 1 W with 6 dBi antenna gain.

>tell me: Is this a hopeless project, or not? And what
>equipment should I use?

I'm tempted to just tell you it's hopeless, and from a practical standpoint it may be. However, theoretically you can do it if you can get access to the proper intermediate relay sites.

The simplest direct radio path would be a NVIS system at lower HF, but you'd only get 300 baud half duplex that way. 56 kb RF modems exist, the WA4DSY, aka GRAPES, RF modem would serve, but you need UHF line of sight paths to make it work. In your terrain, that likely means you'd have to setup intermediate relay sites at one or more points to span the distance.

You need to get a set of topographic maps and plot line of sight paths between your location and the internet POP. Depending on the number of hops you have to use to clear terrain, you can decide if the project is practical or not.

Note: while UHF will reflect and refract across terrain, lots of multipath will kill data performance because of symbol distortion, so you can't just depend on the fact you can use a voice radio over a particular path as a guarantee that data will also flow unimpeded over that path. You need a path that clears the first Fresnel zone to assure good performance.

We have spanned the distance you need over the gentle mountains in North Georgia with a single hop, but that is mountain top to mountain top with a favorable configuration of ridges and valleys to allow path clearance.

If you're willing to tackle this as a proper engineering project, and can get access to install the necessary relay site(s), then this is an entirely feasible project. You may be able to find other amateurs in the area who would be interested in the utility

of those relay sites for their own communications. Then you may
be able to pool talents and expertise to make this a much easier
and individually less costly undertaking. Pooled resources is
the secret of the power of networking.

I just tried it, and got in immediately. Perhaps there is something
wrong with your software or service provider, or perhaps QRZ just doesn't
like your attitude.

I was using a PPP connection, by the way.

>About as useful as tits on a man... "We refuse" What a crock.

They have their uses - sorry you haven't discovered them.

-deletia-

>That is a good question. Perhaps someone with some experience, e.g.,
>using the Symbol Technologies, Telxon, or Tetherless Access, etc.,
>wireless WAN/LAN equipment, will enlighten us.

I'll see if I can shed any light on this subject. This information applies to the USA, and _some_ other countries.

Part 15 devices may be used to link ANY application by the user. This includes data, voice, image, whatever, including Part 97 systems. This is based simply upon the Part 15 rules.

There is, however, a way to employ Part 15 Devices for usage under Part 97, and EXCEED power limits, antenna gain restrictions, and spreading code limitations.

Mr. Robert Buass (K6KGS) has applied for, and has been granted an STA (Special Temporary Authorization) for the use of Part 15 devices in amateur service. This STA allows up to 100 watts of transmitter power, and does not limit antenna gain. It does mention dipoles and yagi's , but does not apparently limit the STA to to use of them, a parabolic would likely be acceptable, if you really need it.

Since that time, the FCC has granted an indefinite time to this STA.

Other amateurs may JOIN the STA, or use it as a guideline to apply for their own STA.

With the use of "Over the Counter" SS radios and amplifiers, and your choice of antennas, a link can be done at many different data rates and interfaces.

Some options for equipment are available on our homepage:
http://www.teleport.com/~nts

Some may be too expensive for your needs, some may be surprisingly afforadable.

Yep, we are dealers of SS equipment. I don't want to get too wordy about our services here. Some may feel that I am just advertising.
Please email me at nts@wolfenet.com

A particularly nice unit is the FreeWave DRG-115, with their 1 or 5 watt "Mast Mounted" amplifiers. These also provide recieve gain.

The 5 watt unit, with a line of sight path, and 12 - 15 Db yagis , will provide a full duplex, 115.2 Kbaud RS-232 path, OVER 60 miles.

No kidding! Makes a great backbone.

For shorter hops, I would suggest the Aironet "ARLAN" line of ethernet
bridges and cards, for connection at 1 or 2 Mb/s.

For further information on joining the STA, see
http://www.sp.nps.navy.mil:80/ss/index.html
This page is operated by Steve Bible, N7HPR, srbible@cs.nps.navy.mil .

Or perhaps contact K6KGS directly.

Robert Buaas, K6KGS
20271 Bancroft Circle
Huntington Beach, CA 92646

I am not affiliated with Steve Bible or Robert Buaas.
I just like to get facts straight, and keep people legal and satisfied with
SS equipment. We provide the best SS radios available.

Hope this helps clear up a confusing subject.

4249. WB7TPY Internet <-> Packet Gateway FAQ

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-09-23 00:00:00 UTC
From: david@stat.com
Message-ID: <giXVBD1w165w@stat.com>
Source record: 41386

How to Use the WB7TPY
Packet <-> Internet Gateway

First, some brief operational notes:

(1) Messages must not contain any foul language, or commercial purpose.
(2) Messages can only be sent to countries that the United States has
a third-party agreement. All others will be destroyed.
(3) Messages from the internet should be less then 5K in length.
No files should be sent.
(4) If you have questions, please do not hesitate to contact me either on
packet radio: WB7TPY@WB7TPY.AZ.USA.NA -or-
Internet : david@stat.com

(5) Have fun. Use the gateway as much as you like. That is what it is
there for.

From Internet to Packet

Send mail to the internet address of:

gate@stat.com

The first line of text must contain a full packet address, preceded with the
word "Packet:"

For example, mail to my packet address, would have the first line of text;

Packet: wb7tpy@wb7tpy.az.usa.na

** NOTE: this line MUST be left justified.

From Packet to Internet

Send as private mail (never a bulletin) to the packet address of:

gate@wb7tpy.az.usa.na

The first line of text must contain a full domained internet address,
proceeded with the word "Internet:"

For example, mail to my internet address, would have the first line of text;

Internet: david@primenet.com

*** Remember, this has to be left justified

Editor, HICNet Medical Newsletter

I am involved in this too, and your comments need to be qualified.
Part 15 devices can be used, but Buass' STA does NOT do away with the
need to ID Spread Spectrum Transmissions under part 97, which is
a major nuisance/problem.

: Good Point. Can you , or any others involved, inform us of ID methods you
: might be using?

: Dean

The system I am designing will use a quick CW id roughly at the center
frequency of the direct sequence spread spectrum emission, by unbalancing
the DBM that is used to heterodyne the "baseband" spread spectrum signal
up the band of interest (or in simpler terms, feeding some of the Local
Oscillator power to the amplifier sections at the tune of a CW id -
using the principle of superpostion).

Hopefuly if this is done very quickly and some precautions are taken, there
won't be much impact on the bit error rate, although I suppose I can
live with a few seconds of higher BER every 10 minutes.

I know that some systems, use fast AX.25 to ID their SS transmisison, but
I consider the CW solution simpler.

But this still doesn't resolve the underlying problem... How does one
properly ID a Spread Spectrum transmission (set aside what part 97 says
for right now)? Even by transmitting CW or AX.25 somwhere in the band,
there exists a probability of interfering with ongoing narrowband communications
in the band (especially on 2 meters).

Bernie

Mike, for such a short distance you might consider using the Part 5/15 unlicensed 160-190 KHz band. This is the area where many of us LOWFER experiment with communication of low baud rate.
However, this seems an even better place to use light beam communications unless you are hidden optically or can not bounce signals around objects. There was a dandy optical commuicator published within the last four months using Radio Shack parts in one of the ham pubs.
This would seem an even better answer. 73 de Cliff W6HDO

Has anyone used these 400 baud downlink telimetry modems in terrestrial service? They worked so very well in satellite service it would seem possible to use them in 300 baud or less HF communications. Granted, BPSK creates bandwidth problems but with aquaquate filtering similiar to that used in MSK a satisfactory HF signal should be possible.
I am somewhat embarrased to ask James Miller but does anyone know if the bit inversion skem in this demodulator REQUIRE ascii to operate or can we simply use any protocol and expect the mark/space to be correct? In his original 1988 articles this was far from clear. 73 Cliff--W6HDO

Jay,

KaGOLD doesn't have a specific dupe function, but you can use the built
in logging easily enough to do this.

The basic idea is to start with an empty log file. As you make each
contact, log it -- On field day I usually put the exchange in the "name"
field (Alt-N). If you connect to a station a second time, you'll see
the exchange pop up in the banner and know you've worked 'em before.

Yes, those are the units it was designed for. The MA/Com units are better, as they use a varactor diode to modulate the Gunn frequency, but those cheap Gunn units work fine. Fine enough... Yep, don't be fooled by their small size, they are only about an inch square, with a waveguide falnge at one end, and two wire terminals at the other end.

> 3) How exactly is the device interfaced?

TTL (or similar) data is sent into a differential transmitter. If you can generate the data at the 2 MB rate it will handle it. Remember that it is half-duplex, because when you are transmitting, you can't subtract your mdulation from what you are receiving. Both TX and RX are on all the time, though, but data is half duplex.

There is a www site somewhere in California put up by the guy who wrote the article in the Handbook, with corrections and updates to the priginal system. Try to find it, it's worthwhile.

Mike,
Get a copy of the ARRL Radio Amateur Handbook (abt $30), it will answer all
your questions.

Best bet for low cost: Cheap FM-band transmitters (Operating under FCC Part 15
authority), cheap FM radios. Transmitters are available from many kit
suppliers for abt $15, try Ramsey Electronics in NY State (look in most any Ham
magazine for the phone #), and receivers are available for <$10 from radio
shack. Use a decent modem (like Texas Instruments TCM 3105) and 1200 bits/sec
is no problem at all.

Here's what I know about KAGOLD.

I bought version 7.xx and it kept blowing me to DOS. I called the company and they said that RF does that. I asked them if it was a product designed to work with RF, and they said yes. So only my RF causes it to blow to DOS, I asked...

Anyway after the typical runaround they told me I needed to get version 8.xx. So I called their BBS and it said I wasn't authorized. In order to get version 8 I would have to purchase a new product. So I called them again and said, I want to keep version 7, just ship me a bug fix. Nope, they said, we fix bugs and then sell a new version. (words to that effect).

It's been several years, but that's the last I cared to know about KAGOLD. During those two years I think they've had about 50 versions. So as long as you want to upgrade twice a month, I'd say have at it.

I have one in my junk box that I can't even give away because my callsign is software protected into it. I guess I'll just format it one of these days and put some Linux stuff on it :-)

Subject: Re: Windows Terminal Program

RM>I would like to use Windows 3.11 on Packet.

There's no better packet program than KaGOLD v9.xx, IMHO! Just a couple highlights of Version 9:

KAM Ver 9 supports G-TOR, the new mode from Kantronics that is about 4 times faster than Pactor, and about twice that of Clover, based on may on-the-air tests. The KAM version 7 rom also allows more NUMNODES (KaNode connects) -- well beyond the original 4 max. Lower the PBBS size, and raise NUMNODES. Ver 9 also displays ARQ link status information including Huffman compressed frame, link speed, error condition, etc.

Version 9 represents a significant departure from the earlier versions of GOLD software. Commands from remote stations are now allowed, two screen modes are supported for every session- - the normal text character screen and a new ANSI graphic screen -- direct interface to callsign databases (SAM, Buckmaster, QRZ) is supported, restartable file transfers, and improved operation in Windows and other multi- tasking environments, and support for CW announcements through ad-lib type sound cards.

o Callbook Support for four (4) CD based systems, and the SAM disk-based callbook. Users can lookup callsign data, the program does lookups automatically, and remote users can request callsign data making the station a callbook server (if remote commands are enabled and the appropriate callbook cmd file exists). Callbooks supported include Amsoft CD, Buckmaster CD, QRZ CD, SAM CD, and SAM Disk based callbook.

o ANSI Graphics supported on all sessions simultaneously. Pics are saved automatically if desired, and the program can "flip" to graphics mode automatically. No other program offers simultaneous, multiple ANSI picture receiving.

o Restartable YAPP and GOLD transfers. YAPP-C is supported, and restartable transfers are done automatically, as the program determines if the remote station supports these features. Partially complete files have a text header that makes it easy to determine which files are only partially received.

o Conferences can be started remotely, allowing your station to be a conference server. Users can switch conferences, start new conferences, and leave the conference and remain connected if desired. They can also send messages directly to other stations in the same or different conference.

o Remote commands, including user defined commands in CMD files. This allows you to create a file server, ANSI pic server, radio mods server and more. The ability to create commands that remote users can issue opens a whole new set of outlets for for your programming creativity.

o Morse messages can be directed to an Ad-Lib compatible sound card. Also, CW pitch can be set by the user, both user options are in the SETUP area.

o Network View lines now show headers in low-video, and text in high-video, making it easier to distinguish headers from text. This is done automatically.

>say we are at the end of the dirt road on the Information Super Highway! I
>am thinking about finding a BBS partner who could forward to my email
>address and then I could forward to the BBS. Anyone doing anything like that?

It is done quite a bit but be aware that there are a few reactionary extremists who believe that the use of other technologies will destroy amateur radio. They believe that amateur radio consists only of rf networking although surprisingly they do accept computer technology and certain other non rf technologies. My suggestion is to do what you find fun, interesting, and gives you satisfaction.

Hi ...

I am not interested in doing it but there is a command that will forward
messages to a file which will then allow the user to pass the file on the
Internet (or whatever).

MSYS 1.19 will have a "software serial port" that will allow two processes
to share information. For example, in DESQview, Windows or whatever you could
run MSYS and a second program you wrote. This program would take information
from and send information to the BBS utilizing the software serial port.
The second process would then change the information to whatever was
needed for the second process. If that second process was a Internet
connection, the boards could forward via the Internet. MSYS 1.19 will be out
before too long. All seems right with Mike for a release.

4272. APRS in 2m SSB sub-band

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-09-24 00:00:00 UTC
From: n7tcf@primenet.com
Message-ID: <443j5e$45l@nnrp4.nfs.primenet.com>
Source record: 41391

Greetings,
I am a weak signal operator equipped for 6m and shorter waves.
The vhf news reflector has heated up after a posting about the use of the lower part of 2m for APRS.
I haven't seen any messages regarding the subject. Perhaps the author is alarmed over nothing.
Such automated stations, if unco-ordinated would make weak signal work impossible. We start with a difficult to hear station, adding splatter from a non-responding automated station will blanket the weak station.
I have not posted this to start flame wars, but for rationale discussion.
There are ways to accomodate all users. Additionally the weak signal enthusiast is rarely known outside their sub-band, we enjoy the challange of near impossible QSOs. An S3 signal is excellent copy.

4273. Help - KAM/FT1000 RTTY problem

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-09-25 00:00:00 UTC
From: slay@netcom.com
Message-ID: <slayDFFzz3.3zL@netcom.com>
Source record: 41260
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment

I seem to have a problem using my KAM (v5.X) with my FT-1000.
It seems that my transmit and receive frequencies are offset
by approximately 400Hz. If you have any suggestions, they
would be most welcomed.

Set-up:

1. KAM (5.X firmware) connected using a custom cable with separate
connectors for CW key-in, Packet, and RTTY on the FT-1000.

2. FT-1000 PKT/RTTY dip switch #5 set to "reverse". At first,
the rcv was okay but the xmit was "inverted". Changing this
dip switch on the top of the FT-1000 at least made both sending
and receiving "intelligible" (with another local station).

3. Software is Host Master for Macintosh 2.2b. (yep - that's right, I
use a Mac :-)

Any suggestions what I ought to try next? To be frank, I don't recall
ever operating RTTY (nor amtor/hf packet) with the KAM/FT-1000 combo.
I have used the KAM on RTTY in the past with my FT-757GX/II ... but
it's been a couple of years since I've tried HF digital. ;-(

Looking for other hams in Calif/nevada/oregon
who like working 80 meter pactor --
...
I have been looking into stimulating interest in an 80 meter
calling freq for pactor ops: 3633 khz (mark tone)
Four of us are active there now:
KI7GF - Larry
NF7V - Jack
WB6HQK - Bart
WA6UBE - Trish
we tend to use ARQ Mailboxes there and for long-winded live qso's, we move
to
3637 khz (mark tone)
...
If you have a kantronics "KAM" unit, set these commands as
follows:
mark = 1000 Hz
space = 1170 Hz
shift = modem
arqbbs = on

dial your rig on LSB to 3634 KHz (suppressed carrier freq) for the calling
channel . OR 3638 KHz for the working channel if you are going
keybd-to-keybd
for a lengthy qso ..

see you there! ..

I've had one for 4 yrs or more, love it. Software dsp operates on the highly-sampled audio signals from your receiver, [as opposed to some things, which just square up that signal...], does a muhc better job of pulling signals out of the mud than any analog filter based things I've used in the past [AEA, pre-dsp, for example], and the protocol stuff, to say nothing of the scope and other options, are just great.

I bought mine from Holland direct, [the price in Europe seems to have gone out of signt, however] called the guys down in Louisiana the otehr day, got very pleasant news on upgrading the software to the current package, will be ordering this week.

I hven't used the Universal or other units so can't comment on them, or on comparisions to them.....

It's likely that your KAM and the FT-1000 are not set for the same tones.
I recall the default MARK frequency is 2125 Hz in the FT-1000 while KAM
uses 1600 Hz (525 Hz offset). Check the respective manuals to set the
two devices for the same tones.

From: jim_g@ix.netcom.com
Message-ID: <445jal$9ak_001@ix.netcom.com>
Source record: 41265

Hi. We have a small group of hams in several countries forwarding via the Internet. Some have expressed interest in finding someone in Japan to join us. If you are in Japan and running an ax25 bbs like fbb capable of importing and exporting mail, please contact me via email. Do not post here please.

Some of our forwarding partners are in Australia, New Zealand, South Africa, Sweden, Italy, Etc.

Also, still looking for a reliable forwarding partner in Minnesota, South America, Holland, and more, so contact me if you are interested.

If you are located in an outlying area and don't have much to offer in return, that is OK to. I will help you out if I can. There are a limited number of hams I can forward with due to the time and cost involved so don't wait too long to contact me if you are interested. What we may do is turn you over, so to speak, to one of the others in the group if I am too busy at the time.

You need to be able to receive large files via email attach. Be carefull now, many have started out and have discovered that their provider goes nuts when I start sending 1meg attachments, and have to turn right around and remove them.

Via ftp site is also a possibility especially if you have one.

>Garmin GPS45. Or, where a place I might look into.
>

Here is the Software setup. Let me know if you want Hardware setup.

How to use the KCP-3 TNC as a remote GPS Tacker
===============================================

Setting for which NEMA sentences you want to record or beacon
You get to set up to 4. I use only two
GPSHEAD
1 $GPGGA
2 $GPRMC
3
4

The LT buffer filled with real GPS data
LT
1 $GPGGA,064301,3250.743,N,09645.669,W,1,05,2.6,236.7,M,-24.8,M,,*71
2 $GPRMC,064303,A,3250.742,N,09645.668,W,002.4,121.2,040695,,*06
3
4

The LT buffer when the GPS is not seeing any satellites.
LT
1 $GPGGA,100552,,,,,0,00,,,M,,M,,*65
2 $GPRMC,100551,V,,,,,,,020695,,*39
3
4

Setting the beacon time for the GPS data (Also the storage time)
I use $GPGGA two times a min and $GPRMC once a min.
Note the offset so RELAY stations have time to respond
BLT
1 EVERY 00:00:30
2 EVERY 00:01:10
3 EVERY 00:00:00
4 EVERY 00:00:00

Setting for the output APRS format
LTP
1 APRSM VIA RELAY
2 APRSM VIA RELAY,WIDE
3 NONE
4 NONE
```

Setting the buffer storage inside the TNC to save the GPS data.

LTRACK
LTRACK 5 LT1 LT2 LT3 LT4 or
LTRACK 5 LT2 for only saving the LT2 data which is $GPRMC
per my GPSHEAD setting.

With the standard 32K of memory 17 is the largest I could set this value. You
can add more memory to the TNC for a larger buffer.

Note the data is stored in the buffer at the rate set by the BLT beacon
command
and not the rate the GPS sends date to the TNC.

INTERFACE GPS When the TNC is next powered off/on it will start in
GPS mode.
INTFACE { TERMINAL | NEWUSER | BBS | KISS | HOST |
GPS }

I also use the Software CD setting.
CD SOFTWARE

How to READ GPS track DATA from the TNC buffer:
==========

You can read the TNC buffer data remotely via radio or by attaching a local
computer
to the RS-232 port.

login to the TNC BBS as callsign-1

LTRack n [string] will DISPLAY LAST n MSGS IN TRACK BUFFER

LTRACK 50 Read 50 lines of data from the buffer
LTRACK 50 $GPGGA Read 50 lines of $GPGGA data from the buffer.

The data is dumped back in LIFO format (last in first out). That is - it is
backward of
what you are expecting for a trip log. I use Mac BBEdit program to reverse
the lines.
The data will plot with APRS even if the trip log is backwards.

>exceed 20 WPM (of course if you're using Morse for content transfer,
>you can ID at the speed of the rest of your transmission, even if it
>is 1000 WPM). I don't think it's legal to ID a SS signal with a AX.25

It is very easy for this thread to turn into a flame war. I hope this
doesn't happen here.

Why do should AX.25 not be legal for an ID as long as the
Spread Spectrum isn't being transmitted in a narrow bandwidth
segment (check out 97.119)? Nothing that I have
seen in Bob's STA or the ID rules say that this can't be done. AX25
can be received on a conventional Phone (FM) receiver, can't it?

>One of the ways you can ID a SS signal (assume PN) is to Morse key
>the wideband signal. The other is to ID on a narrow frequency at the

Unacceptable. The ID function should not disrupt the system.
Keying the SS signal definitely will cause BER to shoot through the roof.

It's analogous to turning the CW id on your local voice repeater way
up in volume, to the point that it interferes with conversations that
are going on while the machine ID's. Or worse, try id'ing your local
voice repeater by on-off keying.

>spreading center, IE turn off PN and narrowband modulate the naked
>SS carrier for the ID. You can use the same baseband method for the

Why turn off the PN at all? By feeding some of the L.O. power through to
the amplifier (see my last posting) at the tune of CW, the system
will be ID'ed at the center frequency, as well as hopefully have
minimum impact on system BER.

>ID as you're using during spreading. So if you're spreading an AX.25
>signal, you can ID with AX.25, or if you're using voice, you can ID
>in voice. You can't ID in a different baseband unless you use Morse.

Says who? I don't see this restriction anywhere in part 97.

Check out 97.119 b) 5) sometime. It only covers ID'ing of SS emissions
while operating in narrow bandwidth segements. Since my system will
operate in narrowband designated band segments, according to
97.119 b) 5) I have to use a CW or phone ID for SS emmissions. So
I I'll have to use the above method, to try to minimize bit error rate
hit, due to ID.

Had it not been for your comments, I wouldn't have taken another look at 97.119. Thanks.... (One less design desition to be made).

Bernie

4281. HELP: TNOS: Where to start?

Hello. I would like to run packet on my 286 and allow access from my Linux machine. I think the best topology is to run TNOS on the 286 and have a PPP link to the Linux machine.

I downloaded TNOS 2.01, and although I am not afraid of the scope of the project, I would like a mentor who could advise me of where to start and how to proceed.

Our local user port is currently being upgraded to THE NET X1J4, and I assume it has to have TCP/IP capabilities for TNOS to work. Is this correct?

Yes, several of us have been doing this for some time. Our
little network consists of N0ARY in CA, KB2EAR in NJ ,
EA3CIW in Spaing and my bbs, W2XO in Western PA.

We send import/export files. These consist of bbs mail starting
with SP, SB, or ST and ending with /EX, all concatenated together.
In the case of KB2EAR, we are using a compression scheme that
Scott came up with to compress the feeds.

Your message header mentioned MSYS. None of us are running MSYS,
but , as long as you can deal with import/export files, it won't
matter. Most bbs software will do this, as I recall.

I assume you are in the southwest. That would be a nice addition
to our little network!

From: Jim Durham <durham>
Message-ID: <4478bv$bsk@dropit.pgh.net>
Source record: 41272

-There have been some changes/improvements in the W2XO BBS
web page.

You can now scan message headers and read packet mail from
the page.

Hopefully, I will soon have a form up for sending mail.

This brings up security matters. Does anyone have any ideas on
how licensed hams could be authenticated so they could send
packet mail via the web? My intial thought was a cross-listing
of e-mail addresses and call letters. A better scheme would
be passwords associated with call letters. Anyone have any
ideas along these lines?

Why not use NNTP and get rid of MSYS totally? Just use JNOS to service your
local users?

Actually, if you set up a phone line, you could completely get rid of radio,
and then your whole system would be much faster.

And it is not possible to get higer bauds on a direct radio path?

>We have spanned the distance you need over the gentle mountains
>in North Georgia with a single hop, but that is mountain top
>to mountain top with a favorable configuration of ridges and
>valleys to allow path clearance.

I think it should be possible to install a relay site on a mountain top
near my hut, to communicate with the Internet POP. But what kind of
equipment will be needed at the relay site? Just a radio with a double
antenna set, or do I need a set of modems to interchange the signals?

My project is still in an early phase, so I really do not know about any
relay sites, but it still would be interesting to know about what kind of
equipment that would be needed for a connection.

I have just gone through some problems with my KAM+ and IC-765 combo that may be of help to you. First of all I had to go into the KAM+ configuration and change the filters for mark and space. The KAM+ as shipped from the factory is not set properly for FSK standards. The second area is the watchdog timer in the KAM+. I found that the IC-765 would drop out of Xmit while the Xmit buffer in the KAM+ was still spewing out characters. On the advice of a friend (K0RC - Bob) I scanned the KAM+ manual for reference to a watchdog timer. Sure enough the KAM+ is equipped with timers for both the VHF and HF ports. This timer will cut the PTT line if you try to transmit for more than 2.5 minutes straight! To disable the HF watchdog timer, open up the KAM+ and locate the K4 header (K5 is the VHF watchdog). Place the K4 header over BOTH pins to disable the timer. No sweat! Works FB now. GL & 73'sslay@netcom.com (Sandy Lynch) wrote:

Hi Sandy. I thot you had this solved by now.
Make life easy... give us some more info:

How have you determined the 400-Hz offset?

Is your TX freq. above or below your RX freq?

Have you adjusted your SHIFT control (from center) to center the RX signal?

Does the KAM have a tuning indicator for RX? Is it centered?

Is the KAM set to decode standard RTTY shifts, or 1600/1800 Hz? (Note that
these are about 400 Hz from the standard shifts).

Good to see you on. - Ed.

4300. Problem keying IC740 withTNC

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-09-26 00:00:00 UTC
From: gerheim@sonalysts.com
Message-ID: <448q2u$26a@hatch.sonalysts.com>
Source record: 41284

I have a technical problem involving the interface of an ICOM 740 XCVR with MFJ-1278 and MFJ-1274 TNC's. I have the XCVR wired for RTTY operation using the external connector on the back panel for receive audio and T/R switching. FSK keying is done via the phone jack, also on the back of the rig.

The problem is that when I try to key the transmitter, it won't transmit, except with the Radio 2 port on the MFJ-1278. With the other ports (Radio 1 on the 1278, and the port on the 1274), the "receive" panel light dims, the relay clicks, and there is no RF output. Everything works fine with the Radio 2 port on the 1278. This problem arose suddenly in the middle of the CQWW RTTY contest last weekend =8^O

The resistance looking back into the TNC's (all 3 ports) is about 4.5 ohms, which seems a tad high, but it shouldn't be rocket science to get it to operate a relay.

Any suggestions? I plan to call MFJ and ICOM, but they are expected to blame each other, and generally be no help whatsoever.

Ouch! That sounds like a bad one. I use amateur packet and RTTY.
The common rate for VHF packet is 1200 baud, but it can be
boosted to a howling 9600 baud. HF packet is 300 baud.

100 km is a long distance for VHF, especially in mountainous
terrain (unless you're _on_top_of_ a mountain).

My experience is as an _amateur_, so please contact the
commercial telecommunications folks in Norway.

I think that you'll be quite surprised at the answers of both MFJ and ICOM. They both pride themselves on their service support, and you will get a fix from either of them (or both!). Both are fine companies, and they stand behind their products. Try calling them. (ICOM is also on CompuServe).

Of course, Gary is absolutely correct, though the level of detail
he gives as an examples is open to discussion; I'd suggest a
number like "gives X BER with G3RUH/K9NG/TAPR (all that apply)
when adjusted for 3KHz deviation" is probably the most useful
number.

>In a sense, the manufacturers of G3RUH type modems are also at

>is now a verifiable standard, a verifiable 9600 baud modem response
>standard should be created, and manufacturers' compliance to that
>standard should be tested and published.

The operating requirements for the original G3RUH modem were actually specified
pretty well in the paper presented by James Miller (G3RUH) at (I believe)
the 7th ARRL CNC. Miller specifies an ideal radio link will have
a flat amplitude/phase response from 0 to 7000Hz. Since few radio
links provide this, the G3RUH modem is designed to allow the transmitted
signal to be pre-distorted so that it cancels out the non-deal characteristics
of the link. For a point-point application, this approach is reasonable,
but the variation in receiver response can make this approach un-usable
very quickly; I'm told that most users of the actual G3RUH modem select
the "flat" response.

I'm complete agreement with Gary with respect for defining what
"9600 baud capable" actually means and providing a method for
controlled verification. Using one of the amateur modem standards
(probably the TAPR raised cosine modem), the BER can be measured
independently on receive and transmit. This is probably the most
practical approach, though specifying a frequency/phase response
(such as "+/- 3dB from 5Hz to 7000Hz, less than 100uS delta in

group delay") would be just as useful.

>Keying the SS signal definitely will cause BER to shoot through the roof.

This is only true if the system is still trying to send data when the
ID function occurs. If the system chooses to stop sending data while
identifying, then no data can be in error, and you've turned what was
a BER problem into a slight reduction in througput (under 2% for a
10 seconnd Morse ID every 10 minutes). Assuming the ID is done using
a narrowband mode, it is no more disruptive to the SS system than
any other narrowband signal. If all of the nodes in a SS network
sync up and start identifying in unison, then the disruption is
even less than an interfering narrowband signal ;-).

However, I do agree finding a method to ID without losing significant
throughput is a good goal, though I suggest it is probably secondary.

>Any arbitrary data stream should work.

The G3RUH (9600 baud terrestrial FSK packet) standard uses direct FSK, i.e. the modem is a pulse shaper, and the baseband pulses are then FSK'd by an FM transmitter, possibly one transition per bit (at the end of the bit). The only other processing in a G3RUH is a 'scrambler' (using a 17-stage shift register with feedback from the 12th and 17th stages). The scrambler is used to put more transitions into constant data (i.e. sending a long series of zeros would be DC without scrambling, and it's hard to get the clock reference from DC). The data to/from the TNC is NRZI (HDLC 0 = transition, HDLC 1 = no transition) due to processing in the TNC logic. Because of this 'differential' sending, inversions in signal polarity in the radios are tolerated. Any format may be passed through the modem, and it will unscramble to the same thing at the end.

G3RUH receiver:

discriminator-->hard limiter --> clock extraction -> unscrambler -- >TNC
(1 bit A/D) (based on transitions) (NRZI data)

G3RUH transmitter:

TNC --> scrambler --> pulse shaping ROM --> FSK transmitter

The discriminator and FSK transmitter are parts of a conventional FM radio.

The G3RUH receiver looks like a sophisticated correlator at first, but the only use of the sine wave in the receiver EPROM and D/A converter is to

improve the resolution of the derived clock to 1/256 bit, while the logic is clocked at 1/16 bit time. Clever, but expensive.

The transmitter EPROM contains several versions of a 'raised cosine' pattern, spanning over 8 bits and sampled 4 times per bit. Additional analog filtering is used before the shaped signal is ready to transmit. These filters need to be modified if the baud rate is changed.

I don't know what the satellite signals are like but I hope this short description helps you understand what the G3RUH modem does (the 9600 baud one anyway, that is the only type I'm familar with).

4311. TPK users - help me with a project

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-09-27 00:00:00 UTC
From: mconner@monarch.papillion.ne.us
Message-ID: <44ai5u$lq9@nlcnews.nlc.state.ne.us>
Source record: 41198

I'd like to help people in my area get started with TPK, but have limited experience with using TNC's other than the Kantronics KPC-3. Rather than go through a lot of trial, error, and frustration setting up the TNC, I'd like to have a "library" of working .SET files that I can refer to.

What I would like is the .SET file you use as a one-time /SEND command to set up the TNC from a complete reset. If you have one that works well, please e-mail it to me at this address, or send it via packet to the address in my .sig. Please indicate what type of TNC (make and model #) and anything out of the ordinary that you are doing that is likely to be unique to your own rig/computer/BBS system (user-specific stuff like personal and BBS callsigns I can find myself).

If I get a reasonable collection, I can make them available somewhere on the net and/or e-mail them to anyone who'd like a copy.

Thanks in advance for your help.

<snip>

Not to begin a debate Gary, but I do beg to differ on an opinion basis with you. Electronics and theory and all other things considered might shoot it down, but last years CQWW Rtty contest North America Multi Op single Transmitter was won by WU3V here in Lafayette, La. At that station there were 5 systems, one running a Hal, two Kantronic Kams, an AEA PK-232, and an AEA DSP 2232. On all 5 stations, which were tested on each band, I saw ABSOLUTELY no difference whatsoever in the performance of a $250 Kam vs. the nearly $1000 DSP box or the nearly $800 Hal. Theory might dictate that the more expensive, more technical, and more sophisticated TU's might work better, but sheer performance has not in 4 years of having my ticket convinced me to purchase one of those modems. They talk fancy, look fancy and work well, but in my well experienced opinion, they do NOT perform better for the increase in price. To boot, the Hal was continuously eatean alive by RF, (blame it on the computer cabinet) but not one of the "external" boxes suffered similar

effects.

As for the P38. That replaced the Hal of last year in this years test. With over a million points its performance was well, (an actually improved with an update of the drivers) but even coupled with the lower price on it, I still couldnt justify the purchase of one, and we're hoping for a repeat of last years title, so I DO take RTTY seriously.

>would be most welcomed.
>
I use a KAM with a TS-930 and use the RTTY FSK input. This allows the
radio to determine the offset, not the KAM. In other words, the KAM
is only switching the radio's FSK offset, as opposed to using the AFSK
feature where you actually feed tones into the audio input of your radio.

Check your FT-1000 manual to see if you can set the shift frequency, 'cuz
there really isn't anything the KAM can do unless you're using AFSK. If
are using AFSK, check the KAM manual because that can also be adjusted
for 170 hz shift, or whatever, as I recall.

The old Kenwood 7950 (and presumably the 7930, its lower-power cousin)
modulate the 10.7 MHz transmitter injection rather than the VCO. Mine
seems to work just fine on 9600 bps simplex. Using it on the 9600
duplex repeater here has some minor problems because the synthesizer
has to relock going between rx-tx-rx when the frequencies aren't the
same.

Subject: FT-1000 and PK232MBX
Reply-To: rsteense@emt.ie.philips.nl (R.A. Steensels)

Hi,

I try to get QRV in RTTY and AMTOR with my PK232MBX and an FT-1000 but I can't get it working. Can somebody who uses the same configuration help me????

Problems:

* Which of the connections on the backside of the PK232 are you using:
the molex connection (2 x flat)
or the round 5 pins DIN-plug

* How is the connection between PK232(Molex or Din-plug) with the FT-1000
I'm using the standard supplied cable (5-wires)

Thanks in advance,

73 de ON4AST

Please E-mail direct.

It is interesting to hear from another poster that a new Azden can still be bought which uses this much better design. Perhaps it is the only design which is suitable for frequency-agile 9600 use. Unfortunately, this technically superior design doesn't sit well with the marketing department, as the transmit frequency coverage won't be as wide (no out-of-band 'mod' possible), and more parts are required (thus larger size and higher cost). Although, if I were to read "Modulated crystal oscillator injection assures fast, clean 9600 baud transmission" in the brochure, I would be inclined to think that this radio had a chance of working well at 9600. If we start to demand that "9600 Ready" radios meet specific (numbers) specifications on 9600 performance (bandwidth, distortion, and very importantly T-R time), perhaps manufacturers will get in line, either regressing to the older "injection oscillator" or finding some other technological fix, as the current hacks to single-oscillator FM mobiles are clearly not capable of doing the job.

If you want to optimize the old Kenwood for duplex use, the 10.7 MHz crystal could be replaced with one 10.7 MHz + (or minus) the split (maybe the oscillator output would need retuing as well). Then set the front panel for 'simplex', but bear in mind that the actual transmit frequency will be different from that indicated. The radio will then have the same performance duplex that it did on simplex. Slow simplex operation could be done without removing the + crystal by setting for minus offset. The optimum situation is to have crystals for the common splits as well as for simplex, so that T-R switching can be done without retuning the VCO in any case.

If you'd rather not modify the radio and take away it's simplex performance, consider a dual-radio installation for working the repeater. Use the Kenwood as is as the transmitter (setting it for simplex), then receive with another radio. Most radios and scanners will receive 9600 fine, the problem is generating a clean transmit signal and switching from transmit to receive in a few milliseconds. You would need seperate antennas or (in the really elaborate setup) a duplexer. With two antennas, the transmitter is going to desense the receiver, but that's how it is with one radio as well. Of course, full duplex at the user station doesn't buy

you anything if the repeater is a simple bit regenerator, not a node.

Although the BER of a radio is important, it is far from being the most
important characteristic in determining whether a particular radio has good
performance in a 9k6 packet link. In Jon Bloom's May '95 QST article, a lot of
attention was given to BER, but one really critical parameter was missing: The
TX/RX turnaround time. If TXDelay can be set to 4 (40 mS), that's fine, but if
TXDelay must be 43 (430 mS), as with the IC-449A, then network performance will
be extremely poor, even with a 10E-9 BER!
Remember that Packet is a bursty mode, and BER measures performance in a
non-bursty environment.
(In all fairness to ICOM, The IC-449A is NOT 9k6 ready, not is it claimed to
be. It is a fine VOICE radio, and a mediocre DATA radio).

Hmmm..... the PK-88 software allows you to set faster baud rates for the
SCC, and the modem disconnection is documented in the schematic. I've
used a TAPR 9600 baud modem with a PK-88 with little trouble. I guess
AEA never plans to sell a plug/play solution, but that doesn't mean you
can't do it; it just requires a little effort.

4322. G8BPQ buffer loss with X1J/NetRom code

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-09-27 00:00:00 UTC
From: w6go@netcom.com
Message-ID: <w6goDFKv6B.D12@netcom.com>
Source record: 41209

An alert to a problem which took me nearly a week to find:

If you define a "NETROM" port in your BPQ switch, with FULLDUP=0, BPQ will use the RTS and CTS leads between the computer COM port and the matrix which feeds the TNCs. When BPQ is ready to send any packet, it first tests to see if RTS is "high". The external 10k resistor you connect between DTR and RTS pulls RTS "high" when no other user of the matrix is sending data.

If, perhaps getting ready for such a connection, you define the NETROM port but do not hook it to a matrix, you must connect the external 10k resistor, telling BPQ that it is ok to transmit data. If you should forget, then BPQ thinks that the matrix is busy, and instead of sending node broadcasts to that port, it dutifully stuffs the node broadcasts into buffers, waiting for RTS to come "high".

If your Node broadcast interval is 10 minutes, and if your node broadcast takes two packets, it will use two buffers. In my case, with 119 buffers to start with and a node interval of 11 minutes, it took about 10 hours for my node to crash.

Conclusion: Make sure the external pullup resistor is in place for any BPQ NetRom ports that are not connected to a matrix. I spent a week figuring this out, you shouldn't have to repeat my steps.

: equipment should I use?
: --
: Svein Yngvar Willassen

Svein,

The response by Gary is right on the nose for earth bound
comunications. If you don't have the time and expertise to
construct the intermeidate relay sites to get over the mountains
that Gary is mentioning...the only other recourse would be
commercial communications satellites...and they cost an
arm and a leg to use...but it would work! Inmarsat has a
56Kb data link capability as an example. Hope that gives you
an idea of the commercial alternatives.

> requirement for the use of their modems. They should. If there

In the manual that James Miller, G3RUH delivers with his PCB's :
------------- qoute --------------------
Page 2, section 1.2.2 :
Transmitters
* MUST generate true FM, as linear as possible
* Deviation response DC to 7.2 kHz (essential)
* Deviation at 4800Hz to be +/- 3 kHz peak (maximum)

<some more text about multi-mode and xtal trx'ers being ok>

Simpeler sythesized FM transmitters, where the varactor modulated oscillator is within the synthesis PLL are generally not useable, as the PLL tracks the modulation, and so you get no LF response.

---------- end quote ----------

James wrote this in 1989.

It is a small 16 page booklet that James delivers with every 9600bd modem PCB he sells. It seems to me reasonable to think that every designer of amateur equipment should be aware of these requirements. And that he can be hold responsible for not correctly functioning equipment.

But then again, James does not mention TX-RX turnaround times at all in this booklet.. And a trx with a turnaround time of longer than 50ms is, IMHO also not usable for 9600bd packet.

Unfortunately, T/R switching time is equally important.

If we assume each transmission has 300 msec. of "keyup" and 600 msec. of data at 1200 baud (900 msec total), if we could run an INFINITE baud rate that would translate to 300 msec. of keyup, 0 msec. of data, that translates to only three times faster (assuming the same amount of data per packet).

Why 300 msec. of T/R switching (TXDELAY)? Because that's the kind of turn around you can reliably get on off-the-shelf synthesized VHF/UHF transceivers.

For the time being, simply knowing the T/R delay is good enough to tell the REAL 9600 baud radios from the "standard product with a DATA jack added" models.

HREVIO.VBX, is a high resolution version of the Event-Driven I/O VBX (CompuServe, keyword "I/O" in the Microsoft forum) for the control of electronic hardware connected to the PC.

To use this VBX you would be working with I/O board (byte/port based, although you may use the printer port as required) and have an interest in hobby electronics and/or data logging and control. This is a fun VBX that adds a windows front end to your project.

Contact Scott at 74514.2615@compuserve.com
On Compuserve type GO SWREG, product id# 5063 for original EVIO VBX

For those interested in doing internet email through ham radio, I have put some notes and useful pointers in my home page:

http://www.teleport.com/~moana/

Let me know if they are useful, and let me know if you have further questions, so I can improve the information.

Btw, TC & I will be delivering a Peterson 44 sailboat from Raiatea to Hawaii starting in mid-October, and we will try to keep in touch with anyone who is interested via radio email. Hopefully we can add some pictures of our adventures to the page when we get home, as well as pictures from our trip to NZ last year.

>who have an interest in packet, most say they can't afford the
>equipment right now.

Why am I not surprised? Many of today's amateurs are technological
illiterates, lost in the mists of time. They don't know how simple
and cheap modern digital methods can be, and they don't understand
the information theory that says how much better those methods can
perform than OOK. In part that's because they've been brainwashed
that "Morse gets through when nothing else will" by our testing and
licensing system, and in part that's because they've never been
properly introduced to modern signaling theory. Most, if asked,
wouldn't know who Shannon was, or if he said anything pertinent to
radio communications.

To be fair, part of the blame rests on the shoulders of digital
operators and equipment manufacturers who have embraced truly
dreadful dreck and pretend it represents modern digital signaling.
HF packet, as presently implemented, is so bad that if the designers
had set out to create the worst possible method they couldn't have
done a much better job of it than what they've produced.

Now I don't really want to slam the fine folks at TAPR, and others,
who trapped us into these systems. I expect most of them only saw
the methods we use as a quick kludge for proof of concept and never

intended for the technology to remain frozen at that primitive level for a decade or more. They grossly overestimated the knowledge of the average amateur and grossly underestimated the inertia of amateurs in general.

The best way I know to undo some of that damage is with discussions like this in forums like this. If the average amateur can be made aware that what's offered to them *isn't* the best, or the cheapest, way to do digital, perhaps we can break out of the corner we've painted ourselves into, and really get some good systems operating on the air.

Gary

I've argued in the past that we'll never have large amateur networks
if we short circuit the necessity for them by using internet connections.
I still think that's true, and if we see amateur networks as only
appendages to the internet, it'll stay true. OTOH, developing seamless
interoperability with non-amateur networks is a Good Thing(tm) because
it enhances the amateur ability to conduct vital communications. What
to do? I don't know anymore. Both sides have good points.

For my part, I'm still pushing high speed UHF trunks and improved
low speed HF methods in the continued hope of having an amateur
alternative to the telco internet links. It's a Good Thing(tm) to
have amateur alternatives where we can experiment and learn rather
than just paying our money and letting the commercial internet
services do all the work. If we become too dependent on the internet,
we might find ourselves in a bind in a disaster when our internet
access is cut off. Large networks take time to develop and debug.
We might not have that time when we need that ability the most
if we don't continue to work on such systems now.

We won't have the impetus or resources to develop our own networks
if routine internet forwarding removes the necessity for those
amateur networks. Temporary kludges have a way of becoming permanent
after a while. I hope enough amateurs still want to build a truly
amateur system to form a critical mass to make it happen.

Gary

Gary,
Your regular postings in the various rec.radio.amateur newsgroups have always been well woth reading. They have been factual and relevent to the thread. Often they have been worth printing out and saving. But I think this time you let your halo slip a little.

It is a very long step from the early writings of Claude Shannon, in BSTJ and elsewhere, to the present day status of modulation and coding theory. The subject is widely recognised as a domain for the mathematical specialist in which many professional EEs (including me) tread with care and respect. To even begin wrestling with the subject requires a wide command of mathematical techniques, whose foundations are not laid until the first and second years of a BSEE course.

Amongst the "practical people", some of the reults of modulation and coding theory are treated with suspicion, because they are often based (but not always it is true) on the assumption that interference o is due to additive gaussian noise. Although to our utter amazement, this assumption has been found to be realistic for the space-to-Earth link, anyone who who has operated an HF rig for a short period of time will know that this assumption is patently untrue for a high frequency communications link. Many coding schemes are designed to bring robustness to communications in a channel for which the statistics if the interference and "drop-outs" are known. If there is a mathematical theory of QRM please direct me to the reference; I would be interested to read it.

There is also a second issue at stake. Widesparead, uncoordinated, initiatives in applying a plethora of diverse modulation and coding schemes to hamradio communication would not only disintegrate the unity of the hobby, they would also attract the disapproval of many radio reegulatory Administrations, who would fear loss of control of the aether.

But more. The tone of your posting goes on to suggest that you would prefer to turn the hobby into an even smaller and elite club than simply an association of "ye olde pharttes who pound ye brass". Now nothing less than a PhD in Information theory would suffice to get a licence.

Please correct me if I have got it wrong somewhere along the line.

You might try Jameco or JDR Microelectronics. It is highly recommended that you get rid of the MF10. It actually degrades performance in a TNC-2. For info on this: ftp.tapr.org in /tapr/software_lib/tnc/tncdocs.exe.

>effects.

If you look at the theory, the BER curves turn asymptotic from 13 to 18 db
above the noise floor for even the cruder methods. What that means is that
if you have sufficient RF signal, it doesn't much matter what box you use.
The differences only become apparent down near the noise floor. If you're
operating a typical contest station with big antennas and top notch radios,
it's not too surprising that you don't see much difference between the
various units. In fact, for contesting, it can be difficult to even
recognize that a signal is there for you to work with the better systems.
They can hear things you can't, and the operator on the other end of the
path might not be using as good a system and so still can't make the contact.
You'll note the advantage most with the better systems on a fixed frequency
link where you don't have to hunt around for the signal you're trying to
receive. As the link degrades, the better systems still work, but the weaker
ones start to fall by the wayside. That's not the way you operate in a contest,
so you generally won't notice that sort of better performance.

Also, if you're using top notch radios and filters, you won't notice
the superior adjacent channel ability of the better systems either
because your radio has already eliminated the problem. A better test
of these systems is with a more modest station. Try the various units
with a simple receiver, even a direct conversion unit, and with a
simple low wire dipole. I believe that you'll notice a *big* difference
then. When you go beyond simple RTTY, the robustness of the various
error correcting modes in things like the P-38 become apparent too
in terms of increased throughput, but that's also something you aren't
too concerned about in a contest.

To sum up, the advantages of the better methods don't necessarily directly add to the basic performance of the station for contesting. If you've already got a good enough signal available, you won't see the full advantage of the better units because even the poor methods are then "good enough". It really depends on where you want to put your money, and what type of operating you do, whether the better systems are cost effective or not. If you're doing HF mail forwarding, and you can't put up a killer antenna, you're more likely to notice the improvement offered by the better systems.

I'm using a IC-735 and a fairly low mounted G5RV, and I notice a big difference between the various units more often than I'd expect you to see differences. (I'm assuming you're running typical contest grade radios and antennas. If I'm wrong about that, then I'm really going to be surprised that you haven't noted substantial differences in performance.)

If you mean PACTerm, it's very basic and not to interesting. I use either
JNOS, if you want to get really involved, Lan-Link, which is a great program,
very useable and has many features. It won't do WEFAX though. I can't find
anything that will. Lan-Link is widely available shareware.

HostMaster will work with it and if you want something really basic but a bit
more functional than PacTerm, the Terminal program in Windows or the
HyperTerminal program in Win95 is fine to get you on the air. There's a boatload
of software that will work with the KPC line.

4351. Recent KaGOLD/PkGOLD comm

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-09-28 00:00:00 UTC
From: jeff.towle@interflex.com
Message-ID: <9509281314.0ILEJ00@interflex.com>
Source record: 41236

In a recent article, a user posted the following remarks:

> There's no better packet program than KaGOLD v9.xx, IMHO!

Version 9 was first released when Kantronics released G-TOR. We did three months of on-air testing with Kantronics to check and debug G-TOR starting in January 1993. In the 18 months since Version 9 came out, we have received many letters, faxes, and E-mail reports from users worldwide who agree with this user.

This was responded to by Mr. Sampson, N5OWK, who has written similar flames on Compuserve in the past. Here is what Mr. Sampson wrote:

> I bought version 7.xx and it kept blowing me to DOS.

N5OWK purchased KaGOLD version 7 in August, 1992 about 4 months after Kantronics came out with their Version 5.xx ROMS.

> I called the company and they said that RF does that.
> I asked them if it was a product designed to work with RF, and
> they said yes. So only my RF causes it to blow to DOS, I asked...

I agree, this is hardly a reasonable explanation, and as the one who handles the bulk of the technical questions, we do mention RF as one possible source of problems, but certainly would not assert that it causes all problem, or even the problem he reported. At best, this was a finding that other users had discovered with their Kantronics TNCs at about that time period, and a problem recognized by Kantronics. Some users found that moving the RS-232 cable away from antenna feedlines or radios helped reduce RF induced TNC failures.

At that time (August 1992) Kantronics had already gone through four ROM releases (5.00, 5.01, 5.02, and 5.0) and as beta testers, we saw even more interim test versions, many that would lockup and cause the program to return to DOS. We were aware that some instabilities still existed in the ROM but after four revisions, the problems were all but eliminated. When version 6 came out the next year, we produced KaGOLD version 8 to work in Pactor mode, and added a number of new features.

As a result of many unexplained TNC failures in version 5.xx, we made a change in KaGOLD ver 8 to avoid returning to DOS when the TNC fails, and simply report that the TNC has failed to respond to a host mode frame. Anyone with version 8 or later can verify this by simply turning off the TNC and waiting for the error message to appear. This is not a bug fix, it was a change to the program to focus attention on the cause of the problems. Naturally, any failure in the TNC would be attributed to

the software (it is easier to identify a software failure than a TNC failure) but many users were discovering TNC bugs using other software as well.

> Anyway after the typical runaround they told me I needed to
> get version 8.xx.
> So I called their BBS and it said I wasn't authorized. In
> order to get version 8 I would have to purchase a new product.
> So I called them again and said, I want to keep version 7, just
> ship me a bug fix.

It is not feasible, and not done by ANY software company to go back to prior versions and make changes and new releases of prior versions. Further, version 7 works fine, it just has fewer features than version 8, or version 9 (released in 1994). Mr Sampson purchased version 7 in August, 1992, and we released version 8 to accommodate Pactor, and other changes made by the TNC manufacturers.

At this point, the other assertions were made about fixing bugs and selling new versions, or words to that effect, are little more than flaming, with very little substance. Also, Version 7 is still being used by a number of people, without problems.

It's been three years since N5OWK purchased version 7.xx, not two, and there have been many changes to ROMs from Kantronics and AEA, and many user suggestions. The reason for new versions of our software are identical to the reasons for new versions of ANY software -- to add features, add support for other new products (CD Roms, sound cards, etc.) and to keep the development moving forward.

Now on to the more important information:

Version 9 of our software has a number of features recommended by users, and to work with new hardware, ROMS, and callsign data files that change from time to time. I want to thank the many thousands of users of KaGOLD and PkGOLD for their support.

Anyone who wants to contact InterFlex systems can
send an E-MAIL to:

support@interflex.com

We welcome suggestions, and comments, and cooperate with any user who calls with questions, problems, or bug reports.

Thanks -- Jeff, WA4EGT

Note: PkGOLD and KaGOLD have been developed by just two authors, myself and Lynn, WB6UUT. We appreciate the positive support and comments that we get from 99.9% of our users.

4356. Spread Spectrum STA information

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-09-28 00:00:00 UTC
From: buaas@wireless.NET
Message-ID: <199509281200.FAA00413@wireless.net>
Source record: 41241

Amateur Radio Spread Spectrum (SS) Special Temporary Authorization (STA)

As has been noted by previous contributors, I hold an indefinite-term STA which significantly relaxes the technical parameter restrictions that govern the formation of SS signals for transmission in the Amateur Service. Operation in the VHF bands is permitted, extending the spectrum available now as part of the current FCC Rules. As Principal Investigator, I coordinate the use of this STA for the benefit of all.

The results achieved to date, conclusively and convincingly, show that properly designed SS systems can operate concurrently with existing users in the same spectrum, with negligible interference and impact to narrowband. The SS systems we designed are SIGNIFICANTLY more complicated than equivalent narrowband systems. The "process gain" derived from the method(s) of spreading the signal provides benefits beyond simply reducing the amount of energy transmitted in any one narrow piece of spectrum. These benefits significantly reduce the effects of (a) energy that would otherwise interfere with or "jam" the intended transmission, and (b) multipath signal fading and degradation. At the same time, (c) SS can significantly increase the total information carrying potential of the spectrum utilized, accounting for its popularity in weak signal space communications. By combining the coding technology used in Forward Error Correction (FEC) with Spread Spectrum, additional benefits are realized. The use of dynamic transmitter control further permits maintaining throughput quality at minimum transmitted power.

There are those who doubt these claims. Fears have been voiced that SS only "raises the noise floor" in the occupied and adjacent spectrum. Opponents of SS have offered as justification, examples of very old designs which, often when improperly adjusted, cause predictable interference. Horror stories and rumors, based on conjecture, are presented as fact. Most vocal are representatives of the VHF and UHF frequency coordination community, concerned for a change in the status quo.

Those who have personally experienced the results of a well designed and implemented SS system know both the elation of the achieved results AND that the fears are without merit. In order that we put these concerns to rest, it is time to deploy more continuously operational systems for those interested to use and objectively evaluate. Please send email to me at the address below if you want to participate in this work.

The objectives of the STA are to:
(1) assess the strengths and weaknesses of the proposed systems;
(2) evaluate the potential of spread spectrum overlay on conventional FM systems;

(3) determine interference impact, if any, to existing users;
(4) evaluate immunity to intersymbol interference due to multipath propagation;
(5) evaluate potential for improved spectrum utilization;
(6) evaluate performance improvement claimed for CDMA; and,
(7) gain operational experience.

Waivers of the following sections of the Rules were granted as requested:
(1) 97.305(c) Column entitled "Emission types authorized" is waived in order to transmit emission type SS in the bands 6 m, 2 m and 1.25 m.
(2) 97.311(c) is waived to lift the prohibition against hybrid SS transmissions.
(3) 97.311(d) is waived to permit the use of other spreading codes.

Our goal is to revise the Part 97 Rules so that all provisions and benefits of STA participation become available to all Amateurs. The STA authorization specifically reiterates the "objectives" paragraph of our request. Further information, including a history of this STA process, can be found at http://www.sp.nps.navy.mil:80/ss/index.html.

In the spirit of pursuing high quality science and engineering, I ask that all prospective participants prepare a (short--2 to 3 pages) technical description of the system they propose. Please including a block diagram of the complete system, showing the SS-unique aspects in detail. The text should evaluate which of the STA objectives the experiment addresses and how it hopes to do that, what results hope to be achieved, and the time frame of the project. Please show the means by which the stations will identify themselves (note that 97.119(b)5 is NOT waived in the STA). Periodic progress reports are required, which are included in our reports to the FCC. They are particularly interested in our findings and observations in the areas of effective spectrum utilization, interference potential and avoidance, code diversity/orthogonality and multiplexed access, and the like.

Once we agree on a project, each licensee on your team will be asked to sign the proposal, providing a declaration of his/her name and address, callsign, license class, license expiration date, and day and evening telephone number where he/she can be reached during the course of the work. When I receive this "formal proposal," I will then provide you with a countersigned copy for your records and you are then authorized as an STA participant. I send the declarations to the FCC on a periodic basis.

Thank you for your interest in participating in this STA, and the larger effort. Hopefully, your enterprise will make a contribution to this advancement.

Kevin,

Something in your remarks reminded me of going over to the Portland Antique Tractor and Gas Engine Festival, in Portland, IN. Here was one of the biggest gatherings of people with this interest in the country. It's really a big deal, all based on antiquated technology. I'm no fan of CW, but I sure loved this show, and I never pass up a chance to see antique technology on display, such as the radio museum at ARRL HQ. As much as I love the olde stuff, I have to agree that we in the mainstream of this hobby will lose all or most of our spectrum if we don't start innovating the way hams did decades ago. I can't help but believe people who cling to CW and analog, voice modes are putting themselves into a special-interest box, and that they will wind up getting together once a year, maybe at Portland... or Newington?

Gary Coffman said...

> Many of today's amateurs are technological
> illiterates, lost in the mists of time.

Gary goes on to mention Shannon and information theory and the
possibility of actually doing something new (or even related to
the later half of the 20th century ;-)) on HF.

MPERRY@estec.estec.esa.nl responded to Gary...

> But more. The tone of your posting goes on to suggest that you would
> prefer to turn the hobby into an even smaller and elite club than simply
> an association of "ye olde pharttes who pound ye brass". Now nothing
> less than a PhD in Information theory would suffice to get a licence.

I have gone back and forth with this since I got my ticket
about three years ago. As an engineer who has worked with
digital RF modulation techniques as well as as quite a few
software communications protocols, I felt amateur radio was
rather behind-the-times. I couldn't even find anyone else
within 20 miles of me running TCP/IP APR. (Though this is
starting to change.)

I have publically argued here that when amateur radio started,
communications was nothing more than RF and simple twisted-pair
telco. I stated (truthfully, I believe) that modern-day telecomm
is a far-cry from that and amateur radio had better pick up the
ball and RUN or risk loosing it all.

But others have said that commercial telco is too big and there
is no way we can compete with it and neither should we try.
I understand this point too. Implememting a multimedia
56kbaud packet network that rivals internet (but entirely
via amateur RF) seems impossible. The time and money required
is, IMO, beyond the resources of even a hobby of amateur radio's
scale. It's a hobby. We have jobs and families to worry about.
Amateur radio is not our career. (At least for some of us. ;-))

So I have some questions for the ARRL or anyone else who cares to answer.

Just WHAT are our goals for the next ten years and what is to be
amateur radio's role in emergency communications in the future?

Yes I know all about hurricanes and earthquakes wiping out
infrastrucure. We probably will be able to serve this need

for another ten, maybe twenty, years. But what do we do WHEN (and there is no IF here, IMO) commercial telco obsoletes us once and for all?

Furthermore, do we really need "goals" anymore or should we finally accept the fact that we are only a hobby (arhcaic in the eyes of many) and leave it at that? Will we forever be a "living memorial" to "the way it used to be", rather than an important hobby that also serves as as an emergency resource?

Regardeless of what WE believe (or want to believe), what do the FCC and the rest of the world think of us? Despite our numbers, we are very much in the minority. Perhaps we must accept that HF will become (already is?) the garbage band that commercial telecomm has abandoned. We will indeed be little more than "ye olde pharttes who pound ye brass".

73

4360. MAXIM analog filter design software for the MAX275

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-09-29 00:00:00 UTC
From: Ingo Schneider <schneider@cf.ac.uk>
Message-ID: <DFnynD.Ew5@cf.ac.uk>
Source record: 41147
Cross-posted to: sci.electronics,sci.techniques.testing.misc,sci.engr.control,rec.radio.amateur.digital.misc

I intend to design an antialiasing filter with the MAX275 from MAXIM.
There is a software package available that calculates the filter
parametres of the MAX275 and plots the filter response. If somebody
has experience with these software - please mail me!

Ingo Schneider schneider@cf.ac.uk

4365. Looking for technical data on ICOM H16T Rx/Tx

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-09-29 00:00:00 UTC
From: supermag@dialup.francenet.fr
Message-ID: <44hki6$pdn@chleuasme.francenet.fr>
Source record: 41152

I'm looking the way
-to setup new channels,
-to modify current channels
-or to remove some old channels
My Rx/Tx an ICOM H16T has been tuned by vendor and
my manual DOES NOT explain how to proceed with frequency tunning.
Each time I need some new frequencies, I have to send back my Rx/Tx
to the vendor and to wait one or two weeks for get it back to me.

PS: I don't use this Rx/Tx for myself, but for a charitable
association which provides all legal permits needed for frequency
use, and which also often changes, adds or removes some frequencies.

Please answer by mail to supermag@dialup.francenet.fr ,
(and don't expect too quick answer)
Thanks.

4366. Re: TAPR TNC-2 PARTS NEEDED

>
> Dave Smith WA1UWU

Once Upon A Time it was a Hot Tip to bypass the MF-10 for simple VHF use. I've pulled several MF10's while I was in there. Don't know that it improved anything. Certainly didn't hurt enough to bother putting it back.

Last time I bought an XR2211 or XR2206 I got 'em from Radio Shack. Suprised? Probably not there any more because they are too high tech. (i.e. Radio Shack customers didn't buy enough). :-)

Normally I'd buy from DigiKey but sometimes one is in a hurry and doesn't need enough other stuff to make a DigiKey order practical.

Hi,
You could give UltraPak a try. The beta version 3.0 is available from
ftp.demon.co.uk in the directory /pub/ham - filename is upak30b.zip.
UltraPak will work with all TNCs except Baycom and has FAR too many features
to list here!
It requires Win 3.11 or later and is Win95 O.K.

Source record: 41156

TE>: Kantronics KPC-3. Iwas wondering if someone could suggest a good packet
>: software to use for packet. Also one for WEFAX. Thanks and 73.

I tried several packages last year when I bought my KPC-3. The only
one that thoroughly impressed me was KaGOLD from Interflex. There is no
better Feature Set out there. A Test Drive version of the "old" v8.0
is floating around - but it really pales in comparison to the new
v9.xx!

You are welcome to call into my BBS at 909-681-6221 and download
KADEMO.ZIP - the Test Drive KaGOLD. While you're online, also grab
PACFAST.ZIP - a very simple, streamlined term program - for quickie
sessions.

Excerpted from "Performance Software" -- GOLD Software User Manual
Copyright InterFlex Systems Design Corporation.

Quick Summary:

KaGOLD adds the ability for you to setup your station as a callbook server,
conference bridge, general file/information server, as well as support for
ANSI pics, restartable file transfers, and more.

Ver 9 supports G-TOR, the new mode from Kantronics that is about 4 times
faster than Pactor, and about twice that of Clover, based on may on-the-
air tests. The KAM version 7 rom also allows more NUMNODES (KaNode
connects) -- well beyond the original 4 max. Lower the PBBS size, and
raise NUMNODES. Ver 9 also displays ARQ link status information
including Huffman compressed frame, link speed, error
condition, etc.

Version 9 represents a significant departure from the earlier
versions of GOLD software. Commands from remote stations are
now allowed, two screen modes are supported for every session- -
the normal text character screen and a new ANSI graphic screen
-- direct interface to callsign databases (SAM, Buckmaster, QRZ)
is supported, restartable file transfers, and improved operation
in Windows and other multi- tasking environments, and support
for CW announcements through ad-lib type sound cards.

o Callbook Support for four (4) CD based systems, and the
SAM disk-based callbook. Users can lookup callsign data,
the program does lookups automatically, and remote users
can request callsign data making the station a callbook
server (if remote commands are enabled and the
appropriate callbook cmd file exists). Callbooks
supported include Amsoft CD, Buckmaster CD, QRZ CD, SAM

CD, and SAM Disk based callbook.

o ANSI Graphics supported on all sessions simultaneously. Pics are saved automatically if desired, and the program can "flip" to graphics mode automatically. No other program offers simultaneous, multiple ANSI picture receiving. Also includes ANSI Preview function [Ins] key.

o Restartable YAPP and GOLD transfers. YAPP-C (checksum) is supported, and restartable transfers are done automatically, as the program determines if the remote station supports these features. Partially complete files have a text header that makes it easy to determine which files are only partially received.

o Conferences can be started remotely, allowing your station to be a conference server. Users can switch conferences, start new conferences, and leave the conference and remain connected if desired. They can also send messages directly to other stations in the same or different conference.

o Remote commands, including user defined commands in CMD files. This allows you to create a file server, ANSI pic server, radio mods server and more. The ability to create commands that remote users can issue opens a whole new set of outlets for for your programming creativity.

TE> What's wrong with the software that CAME with it? I'd also be
>interested in hearing about other software usable with the KPC-3.

Although I love Kantronics' KPC-3s, their Hostmaster really pales in
comparison to KaGOLD...Consider these facts:

ANSI Graphics on ALL sessions, simultaneously with KaGOLD, including
automatic capture to disk. Not supported in Host Master.

Callbook Support -- four (4) CD ROMS (Amsoft, Buckmaster, QRZ, SAM)
and SAM disk based.

Conference Mode -- Automatic, Manual, Remotely Started

External User-defined commands that allow remote users to request
callbook data, start conferences, get files, list directories, and more

Runs in Windows, Desqview, OS/2, DOS, Laptops, Desktops, 8088 through
Pentium, 16550 UART support.

Now, here are some specific things you may want to compare:

Host Master resets and disconnects all stations when it starts up.
* KaGOLD retains connects, does not reset your tnc on startup.

Host Master will not exit in any mode other than PACKET, which means
you cannot exit and leave your ARQBBS on, or leave the unit in NAVTEX.
* KaGOLD allows you to exit in any mode you wish.

Host Master has small scrollback buffers. Default is 100 lines, and the
access to the scrollback is cumbersome.
* KaGOLD has huge scrollback buffers, all dynamically allocated, and
managed automatically.

Host Master has a very limited Help "system" (screen) with no help
on modes, or parameters.
* KaGOLD has a complete cross-referenced help system that covers all
parameters and operating modes.

Host Master uses a "command channel" to set and view parameters.
* KaGOLD allows you to set/change any parameter from any screen.

Host Master has a single binary file transfer system, and only
compatible with other Host Master users. Further, it uses a "pacing"
timer approach which is inherently unreliable.
* KaGOLD supports YAPP, RAW binary, and supports the same system as in
PkGOLD for the AEA PK-232 and PK-88 tncs, and other GOLD protocol
software (dspGOLD, KaGOLD for Data Engine, etc).

Host Master has no Conference mode, and multiconnects are difficult.
* KaGOLD has manual and/or automatic conferences, allows multi-node
conferences (mixing KaGOLD and PkGOLD conferences)

Host Master does not work reliably in Windows.
* KaGOLD runs under Windows, Desqview, OS/2, DOS 2 through 6, and
in VPIX under Unix for the PC. It is "multitasking" aware.

* KaGOLD -- Reliable, fast, user friendly, more features, the best!

>
Just thought that I would toss another idea in. I have a MFJ1278 multi-
mode tnc. While it is perfect on VHF packet, it (and the whole group
of multi-mode tnc's) are not the best hf rtty boxes out there. The
AEAs are better than the MFJs due to their active filtering, but even
they fail when compared to a homebrew(out of the old ARRL specialized
communication handbook). I use an R2000 as the rcvr and I am using
Glenn Welman(KF4NB)'s RTTYg. You can find the program on most bbs's, ham
cd's and I think at the simtel mirrors(oak.ftp etc). I have made
several different "demods" on for typical ham stuff(200Hz bw) and another
for 425Hz press rtty. It is also fairly simple to couple outbard demods
into you multi-mode box(in the ones that use the Exar pll, just "lift"
the pll output pin and feed the output of your homebrew demod(via an
opamp buffer) to that point. It improved press reception greatly.
Just a thought...

4379. 80 mtr PACTOR/G-tor

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-09-30 00:00:00 UTC
From: kk5dr@bga.com
Message-ID: <44jo43$4u6@giga.bga.com>
Source record: 41166

Is there anyone out there that is interested in doing pactor/G-tor on 80 mtrs.
I have tried many times(calling CQ) with no answers, I know G-tor works very well on 80, I've tested it with a
friend, using very low power, the links were very good, even at power levels to low to read on my meter.
If anyone wants to try it with me, I can get on after 7pm CDT.
Matt/KK5DR

kk5dr@bga.com writes:

<Is there anyone out there that is interested in doing pactor/G-tor on 80 mtrs.>

Well greetings! and I hope that you have seen my previous posts on an 80 meter
pactor calling and working channel that I have been publicizing! ..

Try calling one of us on the following frequency (mark tone) : 3633 KHz ..

I have a KAM unit and have set the following commands
as follows:
mark = 1000
space = 1170
shift = modem
...
This way, if you dial your rig's suppressed-carrier freq so it shows 3634 KHz on its display, your mark tone for pactor will be on 3633 (1 khz down) ..
...
we have a group on 3633 consisting of the following members:
NF7V - Jack; KI7GF- Larry; WB6HQK - Bart; and wa6ube - Trish;
...
for long-winded qso's it is recommended to move up to 3637 (mark tone) and use
3637 as a rag-chew channel. For short qso's, or to leave a message in another
net members' mailbox, use 3633 KHz (mark tone) . Jack and I have been leaving our rigs on 3633 (mark tone) for about the past month and are encouraging others to try using this calling channel to establish contact with stations they are trying to find. Mailbox operation works really great when we all monitor a common calling channel .. :-D

4383. RADIOS FOR 9600

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-09-30 00:00:00 UTC
From: lynn.taylor@interflex.com
Message-ID: <9509301116.0FULB00@interflex.com>
Source record: 41170

N>>Unfortunately, T/R switching time is equally important.

N>>If we assume each transmission has 300 msec. of "keyup" and 600 msec. of
>>data at 1200 baud (900 msec total), if we could run an INFINITE baud
>>rate that would translate to 300 msec. of keyup, 0 msec. of data, that
>>translates to only three times faster (assuming the same amount of data
>>per packet).

N>Check my article in the papers of the 14th DCC for a method to increase
>the amount of data per transmission.

Rob,

If you're making the point that sending more data per transmission makes
the T/R switching delay less important, then obviously that is correct.

It's also a very good idea, especially on point to point (inter-node)
links -- even if the T/R switching times are good.

If you re-read my statement it says __assuming__ the same amount of data
per transmission. The intent of the exercise was to show the importance
of T/R switching times, not to explain how one might "get by" with an
otherwise unsuitable radio.

N>>Why 300 msec. of T/R switching (TXDELAY)? Because that's the kind of
>>turn around you can reliably get on off-the-shelf synthesized VHF/UHF
>>transceivers.

N>My experience is that most can do 150ms (not on 1200 baud maybe, but
>certainly on 4800 and above)

My experience is that one of my radios will do fine running as low as
about 80 msec. when talking to a friend's radio. His needs just a
little more time -- about 110 msec.

That's fine when we're talking between ourselves, but if we're talking
to the whole network, and not point-to-point links, you really need to
accommodate the worst radio on the network -- or exclude those
individual stations from participating.

N>>For the time being, simply knowing the T/R delay is good enough to tell
>>the REAL 9600 baud radios from the "standard product with a DATA jack
>>added" models.

N>It isn't. The low-frequency modulation performance of the transmitter
>is very important. The transceiver may switch fast, but still be
>ususable for G3RUH 9600 baud.
>(Use HAPN 4800 baud in that case, it will work much better)

I'm aware of three amateur rigs on the market which are designed for 9600 baud. All three have good T/R times.

I'm aware of probably dozens of "standard products with data jacks" and all have rather horrible T/R times.

I don't know of any radio which is marketed to amateurs which has good T/R switching times and poor frequency response.

Again, I'm not suggesting that this is the only correct parameter by any means -- you are correct to mention frequency response. It is something that you can probably get from the manufacturers specifications, and it will at least "filter out" those radios which aren't really suitable (regardless what the box says).

I'm looking for a simple packet modem to run off of my PC. Any advice (or maybe you have one for sale?) is appreciated.
Thanks Mike KS4DA

How could they find out about it when it has no wires if somone is cloning it or whatever it's called? Also is it easy to do, if your a good programmer, like are there tons of people that know how to do that and do it?
Rob.

4388. Re: The sorry state of HF digital was(Re: Drop Code? No Way!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-10-01 00:00:00 UTC
From: wautelet@innet.be
Message-ID: <AC9477D9966866155@pool02-25.innet.be>
Source record: 41175
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.digital.misc

I read your post abt the state of Ham radio and it's future.

I'm pretty sorry about that future myself.

I'm a ham since abt 1979 and involved (too) heavily into
packet radio when it all started (with Vancouver board,
TAPR etc). At those times, 1200 Bps was quite good as the
average affordable phone modem was still duplex 300 Bps.

Nowaday, it's still 1200 Bps at the user level with a few
link at 9600 mostly half-duplex.

Use of the 23 cm band is very weak (and we have 60 Mhz free there !).

Most hams are still using 2 meter / 1200 Bps access to the "network".

Anyone with a V34 access to their internet provider would laugh
looking at the speed of current AX25 ham "technology".

I'm living in a higly populated and developped country, without
hurricanes or earthquakes and emergency services have all
communications equipement they could dream off, yet the
red-cross maintain some ham organized support that (hoppefully)
is never used "for real".

So the state of Ham radio here is honestly desesperate.

I'm pretty sure more than 50% off people holding a licence
never used their equipement or have sold all of it.

As long as commercial activities does'nt need our bands, we will
keep them, but if there is need for these (especially 23cm and
higher) I'm pretty sure we will loose them quickly. (and we wo'nt
have to argue about that, not using them anyway).

I do'nt think there is a way to reverse this evolution, technology
is just to difficult to developt and build someting ourself (just
look at the price off portable phones vs ham-radio transceiver).

Maybe we should go back to our roots, building simple CW transceiver,
but you wo'nt make a kid dream after that, like it was before.
(Hey, they all have portable phones, internet access etc nowadays).

So you may heard someday "is there anybody still earing me ?" on
the ham's band.

Looking after your through on this,
Have a nice day,

Thierry,

Msg #3904 Type:B For:BPQ @GBR From:G6RZA Date:950922 Length:2389
Title: BPQ and Ethernet but using NDIS ???
G6RZA/TPK 1.82 Msg #:3904 Date:22-09-95 Time:13:39Z

Hello All,

Subject: The use of BPQ over ethernet Using NDIS instead of IPX/SPX.

Action: To be read with a bar of chocky and a large cup of coffee...

You may remember that I issued an SB about same said subject asking
for advice comments etc. a few months ago. Well, the same topic has
come around in a full cirlce and I am again investigating if it is at
all possible.

It does seem so silly to eat up ram loading all the drivers etc for
NOVELL type arangement, when the NDIS soluition is so much neater
plus it does not give me ANY grief in windows and I can run TCP/IP
client as well !

I have found a NDIS<>PACKET drvier interface, and one can attach
the BPQ switch to this driver via the respective interupt, however
I don't think they speak the same "language/protocol ?". as the
whole thing just locks up after a while. (I presume once a poll is
issued from BPQ down the ethernet.)

Now, considering the 7 layer model, I think I have understood the
problem correctly, It is just a matter of getting the different
software to communicate at the correct layer, however, this is
proberly an absolute nightmare, as we all know that ODI spec and NDIS
Spec based on the 7 layer model don't quite sit parrallel. (if you see
what I mean..?)
Another thing to be considred is the fact the NDIS is MS lan-manager
and ODI is Novell type thing, and as we all know, never thet two
shall meet (normaly).

I guess the easiest thing to do would be some nice person to write a
shim, Unfortunatly codeing is not my forte otherwise I would dive
straight in, as it would be an excellent learning exercise.

SO what do the more learned amognst think, I would be quite happy
just to chew a few idears over, it may lead to the preverbiable
100Watt bright idear syndrome and solve the problem once and for all
but on the other hand it may not, but bouncing idears about would be
good.

In the meantime, I will get on with getting JNOS to talk donw the
Coax to the WFW TCP/IP32 stack. (Has anyone else noticed how much
TCP/IP 32 for WFW slows down your machine ??)

I look forward to hearing form yo'all

Best 73,

Mark

4392. Any AEA DSP-2232 users out there??

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-10-01 00:00:00 UTC
From: willhelm@ix.netcom.com
Message-ID: <44minm$9me@ixnews7.ix.netcom.com>
Source record: 41179

I am thinking about a purchase of one of the AEA DSP-2232 controllers. However i wanted a little input from someone who has one (or has had one). I have owned several of the PK-900's in the past and they seem to be a fine controller for the money. But the idea of the DSP processing intrigues me and i wondered if it was really that much better than the analog front end on the 900. I also heard some scuttlebutt a year or so back that AEA had pretty much dropped the ongoing R&D for the 2232 units. Seems like they didnt come out with the SSTV and several other enhancements that they promised in their advertising. A lot of the 2232 owners were evidently ticked off at AEA because of this. Did AEA ever make good on this?? I guess they dropped support for this controller because that didnt sell as many as they had hoped. Anyway, i am not really interested in 9600 baud or working any of the Pacsat birds but would like to try this DSP controller just to see if its really that superior. If you have any comments or info to this effect please email me. It would be greatly appreciated....Thanks in Advance...Bill in Las Vegas, Nv.

>This has the same problems as uuencode (no multipart handling, no error
>control)...

MIME does have multi-part handling. I think you are being confused by
software developers providing minimal implementations to get a tick in
the features list. If they don't even fully implement the standards they
claim to support, it is going to be difficult to get them to implement
new standards.

It doesn't need error control, because it is designed for use over
reliable transport mechanisms, like TCP/IP. (However, I think there may
be some options for overall checksums. If there isn't, and you can
demonstrate a need, you can always raise your own RFC.)

RFC 1521:
7.3.2. The Message/Partial subtype

A subtype of message, "partial", is defined in order to allow large
objects to be delivered as several separate pieces of mail and
automatically reassembled by the receiving user agent. (The concept
is similar to IP fragmentation/reassembly in the basic Internet
Protocols.) This mechanism can be used when intermediate transport
agents limit the size of individual messages that can be sent.
Content-Type "message/partial" thus indicates that the body contains
a fragment of a larger message.

This was in the earlier, RFC 1342, version of the specification, as well.

>Because of this 'differential' sending, inversions in signal polarity in
>the radios are tolerated. Any format may be passed through the modem, and
>it will unscramble to the same thing at the end.

The NRZI and HDLC are not inherent to the 9600 modem, as you note it is
just a FSK modem with fancy shaping. The NRZI and HDLC are artifacts of
the associated *packet* TNC and the protocol it is using. The 400 bps
satellite telemetry modem is different. It is not FSK, it is BPSK, and
it is not packetized but rather it operates on continuous data streams.
It depends for clock recovery on the transmitted signal being Manchester
encoded as I mentioned. This makes it differential or DBPSK, and so is
not polarity sensitive since it responds only to state changes in the
transmitted signal. Manchester coding is different from NRZI because
the data clock is directly embedded in the signal. This means, among

other things, that no data scrambler is required.

At least that's what my memory says. I built one of the things right after Oscar 10 was launched, but have misplaced the magazine article on which it is based.

>Flame Suit On :-)

I don't object, at least not too strongly, to this advice. However,
both of these units do give the digital modes a bad name in the
weak signal arena, because they use suboptimal techniques, and
frankly because they don't even implement the techniques they do
use in an optimum manner. As long as you understand you're embracing
a popular rather than optimum technology, and don't come away with
the wrong impression of what digital methods are capable of doing,
using these appliances is Ok.

What bothers me is that these suboptimal choices are being entrenched
on HF. This is a case of mediocre being the enemy of better. I'd really
hate to see us remain entrenched at this level for another decade. This
is similar to the curse of the PC, with its limitations grandfathered down
to even the latest units in order to remain backward compatible with 15 year
old technical decisions that, in hindsight, weren't very good.

We should be moving away from non-coherent FSK, and we should be moving
away from basic symbol rates of 300 baud for the HF channel. Those are
suboptimal choices for HF digital. Better alternatives need not be more
expensive, or complicated to operate, but if we are burdened by a large
installed base of inferior machinery, there's little incentive to buy,
build, or use better methods, IE we face an interoperability crisis.

It's a very large protocol. Basically it is a virtual circuit protocol, and
has to connect to other X.25. Having played with this on a Cisco router
I can tell you that you can spend several hours getting the timing right.
Lots of little timers in there. Once you got the right settings, it's like
you have found the right key to an encryption device! Data flows all
over the place. Prior to that all you get is error messages :-)

Well that's a long winded reply that tells you absolutely nothing, but I
wanted to say it is complex enough for a book, and in fact you will find
books on the subject at most Universities (some colleges). I think a
couple chapters of those will tell you more than you need to know. Most
people just need to know that you want to avoid it :-)

>be extremely poor, even with a 10E-9 BER!
>Remember that Packet is a bursty mode, and BER measures performance in a
>non-bursty environment.

Packet doesn't have to be as bursty as we do it though. In my 9600 testing, I found that a packet size of 512 was better than 256. But that was with Gracilis PC cards, not a TNC2. The TNC2 bogs down quite a bit after 256. Full duplex circuits can transmit all day...

My point though is that the poor TXD can be offset by longer packets. The packet out to be twice as long as the delay, and low BER circuits can't handle long packets. There must be first derivative of zero somewhere on that curve (packet length vs BER) :-)

4402. panel-type antennas

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-10-02 00:00:00 UTC
From: steve@linux.windstar.NET
Message-ID: <199510021626.LAA08351@linux.windstar.net>
Source record: 40995

I'm looking for suggestions for an improved, low-profile antenna.
Currently, I live in an apartment which limits how I can employ antennas.
I'm looking for an antenna which will improve my transmitted (and received)
signal characteristics over my existing system. My existing antenna is a
gain mobile vertical mounted on a bar crossing an existing window.
Obviously this projects a significant amount of my RF into my apartment, not
outwards.

The window that I am working with is about 30inches wide by about 50 inches
tall, non-metalized. I would like an antenna that has a reasonable SWR
across a relitively small (200khz) section of the 430mHz band, and projects
as much RF as possible outwards. This antenna will be used for packet
purposes on a point-to-point link.

Any suggestions are appreciated!

Steve Schmidt, N3QEM

AEA and their original DSP programmer had a parting of the ways after the satellite modems were completed. (I won't get into that, having only heard the programmer's side of that dispute.) Anyway, that stopped DSP code development for the unit for some time. The rumor mill had it that AEA had engaged the services of another DSP programmer, but as you note, there doesn't seem to have been any further code released for use with these units. At this point it is reasonable to question if there ever will be more code released for this box.

AEA did release some documentation on this unit so that independent programmers could work with it, but I haven't seen any code released as a result of that (Grace's DSP-12 seems to share a similar fate). TAPR seems to finally have their DSP card available for programmers to use, but again code has been slow in coming, and it's priced higher than many available alternatives.

Other DSP solutions intended for amateur use have also appeared, including the HAL P-38 card and the PACTOR II unit from Germany (also to be second sourced by PacComm). These units seem to have committed development teams, and likely have a future.

In the meanwhile, DSP evaluation kits, and sound cards bearing DSP processors, have become available which are much cheaper than any of the above units (most available for under $100), and for which cheap (or free) development tools and documentation have become available. Among these are the TI kits, the Motorola kits, and the

Analog Devices kits. The latter chipset is also used on the inexpensive Cardinal sound card, which also has an available software development toolset. And there is an IBM sound card bearing the TMS320C25 DSP chip as well. The sound cards are particularly attractive because of their tight coupling to the host PC, but most of the evaluation kits are also suitable for use as external modems for ordinary TNCs.

So what's a buyer to do? I'd suggest that if you're happy with the current code available for the AEA or Grace boxes, and if you can stomach the price, you go ahead and buy one of them. However, if you're expecting lots of enhancements down the road, you'd do better looking at the platforms the code developers are embracing.

Becoming a code developer yourself is an option. In particular, the TMS320 family and the ADSP-2100 family are well supported with tools and example code. The Analog Devices unit in particular has an available set of source code cookbooks that implement everything up through a V32 modem on their EZkit development platform. It only took me a couple of days from ground zero to get a functioning FSK modem programmed on the EZkit, and I'm no DSP programming whiz, in fact this was my first attempt at practical DSP programming. Because of that, I'm sure the implementation is far from optimum, for example I still haven't figured out a good way to communicate tuning indicator data to the PC for display, but the darn thing does work, and pretty well too, even with moderately weak signals. Really weak signals, ones I can't detect by ear, will have to wait on my figuring out the tuning indicator problem and shifting to a more robust encoding than naked FSK. One of the cookbooks has a trellis coding demodulator that ought to serve for really weak signal detection.

(Really weak signal performance probably isn't very important to you since most HF signals are at least moderately strong, but it's a current pet enthusiasm of mine.)

Matt/KK5DR

Matt: we've recently been doing a lot of short-distance (<150 mile) AMTOR/PacTOR/GTOR/Packet tests on 80m in New England using an automatic test program we've written. It measures link time and throughput in chars/sec. Would be more than glad to try some 80m and other-band tests/ops with you. Gimme a shout at kwick@mitre.org. 73 Ken.

Hi All.

I have two Motorola Rnet 9600 Simplex radiomodems and I am looking for terminal software to drive them. These modems make use of RTS/CTS hanshaking so it must drop the RTS signal after sending its data/databuffer in order to let the other modem send its reply.

Thanks for your time.

Hello amateurs,

I run APRS software. I tried to track the N9WST balloon flight
of 9/30. When I went to save the run in the backup file
at the end of the day, I goofed up and did not save the history
track so I cannot replay the run. Does anyone have this track?
It would be an ASCII file so it could be e-mailed easily.

Thanks.

Yes, Kevin, you are just too much of a tech weenie, but without the years to support the half vast claims you make. Nothing is further from the truth than old ham radio is defunct. It is not and never will be since you fail to recognize the difference between social aspects of the hobby and the technical aspects that are possible. Take a few more years of observation before you tell the rest of us "old farts" where ham radio is!

>

Last spring, I bought an old Standard 2 channel crystal controlled mobile radio that was originally set up for 460mhz. I got the manual, too. I was going to use it for 9600 baud TCP/IP. Someone had "converted" it to 446, by simply retuning it down. The radio was basically deaf. In order to "make it hear", I retuned the helical front end by removing the cans, and rewinding the coils - adding about 3/8 turn to each in the process. Standard included a table of front end filter coils in the manual for each of the bands this could be tuned on, from 400 to 470mhz (excluding 430-450). I interpolated to get the required size for 440.

I now have to go over the PA, and make sure it's clean. Output is down from spec, and tuneup was very touchy, so I have a feeling it's going to need some work. Now that I have a spectrum analyzer, I feel much more comfortable about tackling this.

This radio should be an ideal radio to dedicate to 9600. It's crystal controlled, and uses electronic switiching, so turnaround time will be very fast. Power output is rated at 12-25watts, if I remember correctly. It was fairly cheap - $50 with the manual. But I probably could have done even better. Conversion involves some work, though and the proper instruments.

If I ever find the time to finish this project, I'll write it up, I promise...

You mean the bunch of (mostly) old men meeting each week at the
ham radio club to drink a beer (away from wife's eyes) and recounting
how nice things were, when they were younger ... :-)))

That's NOT the hobby I started 17 years ago.

HF contact are now mostly "contest style" 5 seconds exchanges.

VHF repeater are CB-like nonsense.

Technically, the most difficult thing is to get the japanese made
tranceiver out of the box and reading the programming instruction
of the on-board computer.

That's today Ham-Radio ...

Have a nice day,
Thierry,

As a licensee, you can do whatever you want on 2m. There are some
restrictions, but remote control isn't one of them. If you mean radio
model control then no. Common sense tells you that thousands of
talkies all looking at you controlling your model will key up to kill it :-)

4420. Best packet pms/host?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-10-03 00:00:00 UTC
From: kavman@news.gate.net
Message-ID: <44rh01$2dqg@seminole.gate.net>
Source record: 41007

Can you recommend a good host or pms program ? Ideally, I'd like
something that provides enough of a scripting facility for me to be able
to pull selected messages (bulletins) off of the local packet BBS, and
also be able to receive forwarded mail from the BBS.

I'm running a 8 Mhz AT (640K) and a KPC-3. The KPC-3's pbbs is fine, but
too small for "serious" work in capturing bulletins.

I've tried: paKet 6.1, TSTHOST, PTM, Eskay Packet ("sp")Lan-Link, and while
all are good,
they all have limitations (not enough built in editor space, PMS problems
(loosing track of BIDS...etc.) to make them unacceptable.

Please let me know of any Internet sources for the software you recommend.

Thanks!

Joe

Monitor some packet freqs (mon on command) and watch for people
disconnecting. Then try to connect to them. You'll know right away if
your close enough to reach their station. I'm told HF packet is slow (300
baud so it figures!), might not be worth it but that's up to you.

The Rochester Packet Scociety has assembled and tested about 250 Baycomm modems. I use them in portable operations all the time. For the average user they work great. Things to know:

This is a DOS program. It probably won't work under windows.

It works great on original XT and slow computers.

It must run on a IBM compatable computer. Although with programs designed for other computer you can use the same modem. I have seen the RAPS modem running on MACs using SoftKiss and Amigas using a program that I forgot the name of. Baycom was written for the IBM.

We give out the 1.4 version of BAYCOM. Baycom is currently two versions ahead of that. To upgrade past 1.4 you must register the shareware. PACCOMM is the US rep.

The RAPS modem uses the same modem as the PACCOMM TNCs.

$30 aligned and tested. software and docs included, no cables.

The serial port must be IBM compatible. Some lap-tops might not be able to power the modem so separate power might be needed.

I'm willing to swap your fried TNC for a BAYComm setup.

I will need to know what the connector is on the comm-port you will use on your computer (9 or 25 pin) and what radio you are using and the mike pinout.

Thanks.

Your point is absolutely correct, but the original question was not 'how do I work around an awful radio' but 'what should I look for in a _good_ radio?'

Also, I think you mean 'High" BER circuits - a low BER circuit has very few bit errors, and handles big packets fine.

BTW, some of the networking software writers are working on supporting 1k frame sizes, so we should see something soon. Full dux isn't the panacea for poor TXDelay, though, because it needs a high utilization ratio to be considered efficient, but I like it because it forces you to use dedicated point-to-point links. Most people don't realize it, but since X.25 (the basis for AX.25) is a point-to-point protocol (not confused with internet PPP), as soon as you add a third station on the channel, throughput drops like a stone.

Many links could be vastly improved in performance by just making it a link between only 2 stations, no need to up the baud rate...

That makes sense, but then the question becomes "what is considered a model?". Packet stations can be used to report telemetry from say a weather station, but how about control of a experimental robotic platform? I believe that was the question originally asked. Since this is "mobile"; not really a "model", but is used for remote control, is this legal for a ham?

It could also be that he's (or she!) is running more power and you
aren't putting out enough to reach them. Just another idea. I sometimes
see stations when monitoring but when I try to connect it's no go. Too far
away for me and I'm not cranking out enough power. Try popoing up your
power if possible and see what happens.

The title of the thread does suggest we should keep that in mind. Besides being a waste of time, TxDelay is also a 'window' where packet collisions can occur (one station has decided to transmit; other ones can't hear it). So regardless of the packet length, the transmit delay should be as close to zero as feasible. It really isn't related to packet length at all.

Another related timing issue is how much preamble the receiver must have before it can successfully decode the packet. This is TxDelay that must be added in addition to that required by the sending radio. It is generally a modem/TNC performance measure, unless some idiot insists on using the RF squelch in the radio.

The time for the radio to start receiving after it has stopped transmitting is also important, but less so than the other two. Adding some RESPTIME (time after receiving a packet before responding to it) will compensate for this with a little degradation in point-to-point links and probably not much at all in a multi-user situation. Adding TXDELAY instead of RESPTIME in this situation should definitely not be done as will allow more collisions and QRM the channel with useless Flags. Many radios can be modified to start receiving faster by disabling the circuit which turns off power to the receiver IF and audio circuitry while transmitting.

<snip>

>BTW, some of the networking software writers are working on supporting 1k
frame
>sizes, so we should see something soon. Full dux isn't the panacea for
poor
>TXDelay,

There is no cure for long TxDelay. The best bet is deterministic access with the TxDelay of each station accounted for, but that seems excessively complicated compared to building good radios in the first place.

> though, because it needs a high utilization ratio to be considered

I don't see how full-duplex requires point to point links, I suppose you are talking about a bit regenerator rather than a full-duplex node.

>Many links could be vastly improved in performance by just making it a
link
>between only 2 stations, no need to up the baud rate...

There are several other things that should be considered, longer packets being one idea along with:

* Forward error correction. Could be backwards-compatible added by sending UI frames with error check/correct bits immediately after a conventional data frame. Also the level of ECC transmitted could dynamically vary depending on the number of errors actually experienced. The need for FEC will be even more acute if packet lengths are increased.

* Smart REJs. As AX.25 works now, for example if a group of 4 packets are sent at once and the first one is missed, the other 3 must be retransmitted as well. Sending one long packet instead of 4 short ones has a slightly worse effect, if one error occurs in it the whole packet must be re-transmitted. Improving the REJ process so the correctly-received packets further along in the sequence are acknowledged would be a very worthwhile development. Also this would make it practical to have a window of more than 7 outstanding packets (even 7 is way too many now, unless the link is absolutely perfect). Then the amount of data per transmission could be increased, by sending many short packets with an ability to retry individually any that are missed. This would be much better under moderate to high error conditions than keeping the present retry protocol and using long packets.

* Deterministic access (What ever happened to DAMA?) For point to point links even more drastic fixed time-slot type methods could be used, saving the need to send 'polling' packets. Either way, more than 2 stations could work work without the increasing chance of collisions that occurs with the present random access system. This may be especially good for half-duplex nodes, which are almost always a 3-station situation at least.

* Full duplex with remote DCD. With a full-duplex node, there is the possibility of communicating the instantaneous uplink DCD status to all the users, thus reducing the probability of collisions from 'hidden stations'.

This could be done in a manner similar to the 'busy bits' used by the digital control channels in cellular phones. If FEC is implemented, full-duplex nodes would 'scrub' errors out of packets before repeating them.

Full-duplex bit regenerators should have some 'hang time' like voice repeaters and transmit a continuous series of Aborts while the input is idle (with modification to the end stations of course to consider this condition 'no DCD'). In this way, all the end stations can maintain bit synchronization, and know immediatly when the input is idle. Additional TxDelay resulting from the repeater is not needed.

* Split-rate installations. Almost any radio can be modified with a simple tap of the discriminator audio to receive 9600 baud, but few can transmit it acceptably. Therefore, some way for primarily one-way links like those to BBS and DX Cluster users to downlink at 9600, but uplink at 1200 may be useful in the interim. (It should probably be done on two different frequencies, i.e. an optional 1200 uplink-only channel in addition to the conventional 9600 channel.) Presently, there seems to be no hardware on the market which can operate in this manner.

In conclusion, it seems to me that there is a fascination with baud rates because it is an easily quantifiable thing, fairly simple to implement, and it "feels right" that increasing the baud rate means faster throughput. Of course it does, but that doesn't mean that the rest of the system is anywhere near as efficient as it could be. The present implementation of AX.25 works marginally well with small quantities of data at 1200 baud, but is definitely showing its wire-line heritage by its incredibly poor handling of errors and multiple access, conditions common in radio links.

>Don N2IRZ

Give that man a CIGAR!

Packet networking is like sharks to blood. Some idiot puts up a netrom
node (or rose, or whatever), and 10 other people say "Me Too!"

If these node admins would change frequency every time some shmuck
put up another frequency cross-over, they could keep the through-put up.

9600 went the same way as 1200! All are backboned on the same freq,
with omni antenna's - no point to point. Cheap bastards...

I did a paper once on a 3 radio node stack. 1 for 2m (the user freq, omni),
and two 9600. One for the route north, and another for the route south.
Using TEKK and beams I figured we could run from OSU to OU in five hops.
Do it TCP/IP on the backbone, and that and regular AX.25 on the 2m side.

Nope, no one interested. They like crap, NO they actually love crap...

The simple model of one link pointing to the next link and running full-duplex is what he means I'm sure. The bit regenerator "full-duplex" while 100% better than the current method of networking, is really only good for each local LAN. That is, the LAN users should hear everyone else, and that will reduce collisions (DAMA does the same thing but is much slower, because it is master, and everyone else is slave). I don't know why they call that full-duplex, because only one user can transmit at a time.

Take one of these and hook it to a Pt-Pt links to the next LAN, and that's what I mean. Full-duplex here, means that each end of the link can transmit any time they want because they are the only two on the freq pair.

>> Why not use NNTP and get rid of MSYS totally? Just use JNOS to service your
>> local users?

JNOS does not epitomize the concept of "user friendly" software. (I've
used it heavily. It makes a good IP router, though.)

>> Actually, if you set up a phone line, you could completely get rid of radio,
>> and then your whole system would be much faster.

The granularity of time slices on a phone line do not lend themselves
well to TDMA networking :-)

>It seems to me that forwarding over internet - or other commercial/educational
>or governmental network has nothing to do with amateur radio.

Then we need to ban phone patches, too.

Seriously, the entire issue of BBS forwarding - both mail and bulletins -
could take a lesson from the Internet.

NNTP has a place here. What has turned most BBS operators (and users) off
is the need to switch to IP based networking. While I would like to see
that happen, most people don't want to be bothered. HOWEVER, there isn't
anything stopping us from using NNTP over AX.25 VC's. All NNTP wants to
see is a reliable sequenced link between end-points. In this
respect there is no difference between TCP and an AX.25 VC. What *is*
different is the addressing scheme used to identify nodes on the network.
And in this case, never the twain shall meet.

The same argument applies to mail traffic. SMTP doesn't care about the
underlying transport, as long as it provides a reliable end-to-end
sequenced data pipe. And again, the addressing simply does not jive
with the current BBS addressing scheme, thus the user community shuns
it because they would have to learn something new. This is a shame, as
there is some very good work coming out of the IETF right now that
addresses many of the problems we face (specifically addressing
unreliable connectivity, sites with limited resources, etc).

It can be made to work, though, if people agree to cooperate. Internet
domain based addressing works just fine over UUCP for both mail
and news. UUCP is a store-and-forward network just like the current BBS

network. Given a scheme for distributing the routing tables we could merge the functionality of Internet domain addressing with the AX.25 transport layer in a seamless manner, providing better connectivity for all (and that's what ham radio is all about).

For this to work we need three things:

1) Cooperation from the BBS software authors to implement the new functionality (specifically SMTP, NNTP, and RFC822 based mailers). This has been done many times over, and much of the code is available and can be re-used for this application. (Check out your local land-line BBS for an example.)

2) A distributed network routing database (ala the UUCP maps).

3) A user community willing to accept change (a new addressing format).

I hereby step forward and volunteer to take on #2 above. Who else is willing to contribute to moving the BBS mail/news environment forward?

I'd like to jump into this discussion if I can. I have seen numerous posts to this group asking about which 9600-baud ready radios are worthwhile. I've never seen a good list. Based on the discussion of this thread, there is an implication that NO "9600-ready" radios operate with acceptable quality at 9600. Is this was the discussion implies?

I am interested in a mobile 2m/70cm radio for use in my car and as a packet station. I would like to run at 9600. I posted a question regarding radios of this type months ago, but received no answer. I think a number of folks would like to hear from people who are actually operating at 9600.

Which radios, if any, provide reasonalbe performance?

You need a Kantronics KPC-3 TNC. It has one of the smallest footprints of
any TNC, will run on an internal 9vdc battery, can do WeFax, and is reasonably
priced at about $100 new. I have 2, and love them both. BTW, the new version
firmware supports stand-alone GPS interfacing for APRS and other applicable
needs. +================================+==================================+

Not exactly. Once the transmitter is up to power, and on frequency, the flags sent during TXDelay are hearable to other stations, and cause DCD to light. (But, before the TX is ready, yes, it is a hidden transmitter. On a practical basis, this isn't a huge problem. But the point, that any TXDelay is evil, is well taken)
>
> I don't see how full-duplex requires point to point links, I suppose you
> are talking about a bit regenerator rather than a full-duplex node.

Actually, I wan't thinking of a bunch of half-duplex stations talking through a duplex repeater, but tow full duplex stations talking to each other. both transmitters are always at full power, both receivers are always listening. A third station simply cannot fit in.

> * Deterministic access (What ever happened to DAMA?) For point to point

It is coming! Keep your eyes open for info about FlexNet, very popular networking software in Europe. Read about it in the latest DCC proceedings. It implements full master/slave DAMA !!

>
> * Split-rate installations. Almost any radio can be modified with a simple

This isn't as easy as it sounds, but probably doable. We are playing with a similar split-rate idea: 1k2 (or up to 9k6) from user to server, and 56k from server to user. Such a wide split is hard, though. Think of a WWW site: mostly mouse clicks in, and tons of data out. perfect for a split-rate channel. (BTW, anyone interested in this, E-Mail me!)

4442. Do you use technology in your club? Please Read.....

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-10-04 00:00:00 UTC
From: aruss36461@aol.com
Message-ID: <44vkfk$dq9@newsbf02.news.aol.com>
Source record: 41029

I have been asked to research how different amateur radio clubs make innovative use of technology to communicate to, and with their members. I have volunteered to research this issue for the Montgomery Amateur Radio Club in Maryland. My goal is to present a report to the membership on how others are using packet, the internet, BBS services, voice mail, and even programmed repeater announcements to keep the flow of information in front of the members. I feel strongly that the time has come to consider the club newsletter as only one vehicle for the dissemination of information. Your comments are appreciated. If you are a member of a club, please share with me what your club does, or what you wish they did do.

When all responses are compiled I will make the total file available for anyone who wishes to see it.

Thank You.

I'm not sure I would agree with this. There are plenty of
phase modulated crystal controlled radios out there (well,
a lot of land mobile radios) that have spiffy T/R times but
do not have the correct frequency response. I think Don
was trying to say T/R time is not so much more important
than other characteristics that it is some kind of litmus
test all by itself.

You need a radio with a proper frequency response to operate
9600 baud at all; this radio also needs a fast T/R-R/T turn
around in order to be efficient. One doesn't take priority
over the other.

>
>Any suggestions are appreciated!

Steve, go to the dump and grab a couple of oven racks. Join them at
a 90 degree angle (wiring them together will do), and mount a dipole
along the axis of that join, spaced out about a 1/4-wave with a stick.
Viola, you have a corner reflector almost as good as one you could buy
at Radio Shack for $7. It will have good forward gain, and a *great*
front to back ratio. Just what you need for a pt-to-pt link. (You could
also use chicken wire over a wooden dowel frame if you don't want to
scrounge in the dump. Or you could just buy one from Rat Shack and
replace the driven element.)

You *could* use a yagi, but the corner reflector fits a window
well, and should serve your purpose with a minimum of tinkering.

Hello,
I'm build a Serial Communication Card (that I've named NSCC) in the respect
of semplicity.
I'm going to collect all file about it to a package for placing it in same ftp
site.
The overall feature are:
- 4 full duplex channel
- non INTACK or DMA
- about 10 ICs on board
- 1200AFSK modem on board (if you want)
- easy PCB to realize
- schematics and PCB artwork available in HPGL, LaseJet II (and Postscript)
- usable either in XT or AT bus (IRQ 9, 10, 12, 15 available)
- all hardware port available
- ask for other feature I don't remember now

But the question is the following: is someone interested in it?
Thank you very much for response.

NOTE: Tigertronics (above) also makes a telemetry modem for just for applications like this. Unlike the BayCom modem, it uses standard COM port communications and thus can be used with just about any terminal program. You may even be able to use the demo software for the model telemetry you have in mind. The modem is called the RTX-12 and sells for just $60 in single quantities.

..It is possible but it would be complicated and expensive and probably
not accurate enough for flying purposes.

Global Positioning receivers would be much smaller, lighter and faster
but need a flat antenna about three inches on each side to operate. GPS
also provides altitude and good receivers can give you direction of
travel and speed. However, they are only accurate within about 30 meters,
as i recall, so i'm not sure even they would work for your application.

Any way you approach this it is going to equal the cost of a good R/C
helicopter and probably more.

I think you are looking for a Bessel type filter with constant group delay.
This is a common filter architechture, and should be realizable in the bandpass
configuration you require. Try Frequency Devices Inc. in the USA, they make all
sorts of filters. A switched cap filter has certain peculiarities you may not want.

From: wa6ube@aol.com
Message-ID: <4514nq$nja@newsbf02.news.aol.com>
Source record: 41043

for info, a group of hams on the west coast have been experimenting with
the
idea of a calling and working channel for 80 meter pactor.
we are: wa6ube-trish; KI7GF- Larry; NF7V-Jack; and WB6HQK-Bart
The system works well and is a great way to leave a mailbox on and
leave messages for each other and do keyboard-to-keyboard.

Try the following frequency some time: 3633 KHz (mark tone)

For long-winded qso's, move up to 3637 (mark tone) .

to make frequency setting easier when using the KAM unit by kantronics,
set the following commands accordingly:
mark=1000
space=1170
shift=modem
This way, to set your mark tone on 3633 KHz, just set your radio's
displayed suppressed carrier frequency to : 3634 KHz .
also, the displayed "working channel" would show up on your display
as: 3638 KHz (mark tone is exactly 1 KHz down from suppressed carrier
this way) ...

Only if it comes with a driver for NOS, and I would want DMA for speed,
but polled operation up to 19.2k is good I guess... Total cost should be
under $125, as DMA cards are available in the $150 range.

> and thanks for all ideas! 73's N0ZYA

To start live packet QSO's monitor a frequency and see if you hear
any cq's. Send out for pizza every day around 6PM.

To improve live packet QSO's, I've found it useful to ask the other
station to QSY. They are normally connected to other stations and
refuse, but it's always fun to remind people that there's an advantage
to spreading out. :-<

I'm trying to finish a WAs on FSK (RTTY and/or Data), and
have been running HF packet. Basically, it stinks, but I only have
a few states to go, and there's _no_one_ on 45 baud RTTY except when
there's a contest.

4463. TTY/TDD MODEMS?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-10-05 00:00:00 UTC
From: bcdlr@aol.com
Message-ID: <4521a6$4v5@newsbf02.news.aol.com>
Source record: 41050

This is not exactly ham related, but I thought this would be a good place to start. Does anybody know of a PC internal or external modem that will do TTY for a TDD type connection. I believe the protocal is 45.5 baudot?...
I am looking for a cheaper source for a friend. One company sells a PC modem to do this but its over $300. Sure seems like there should be something to do it cheaper.

Non-DMA? Is that what you are saying? DMA is just fine and dandy if its done right. Then again, everything is just fine and dandy if done right.

> - about 10 ICs on board

Thats a lot! Were you planning on discrete logic or using programmable logic?

> - 1200AFSK modem on board (if you want)

No. Save the PCB space.

> - easy PCB to realize
> - schematics and PCB artwork available in HPGL, LaseJet II (and Postscript)

Gerber my friend. If one were to take your design to a PCB house in the United States and try to pay to have a PCB etched they wouldn't know what to do with the formats you list. Need (1) Gerber file and (1) Gerber Aperature file for each layer of the board. They could print film from Postscript but then none of the automated design rule checkers they have would be able to make sense of it.

And lets not forget a drill file.

> - usable either in XT or AT bus (IRQ 9, 10, 12, 15 available)

I wouldn't spend much time trying to be XT compatible. Altho there are a lot of hams who would differ with me. You'll probably have enough on your hands just doing the AT part right. Add XT compatibility later if you wish.

> - all hardware port available
> - ask for other feature I don't remember now

Since you ask, I want 1) ethernet, 2) standalone, 3) 4G DRAM, 4) 100 MIP CPU, 5) cost under $50, 6) delivered yesterday. :-)

> But the question is the following: is someone interested in it?
> Thank you very much for response.
> 73 de Lapo IK5NAX

Who is going to write software for it?

Is the hardware design going to be free/public-domain? shareware?
freeware? licensed? GPL?

Is anyone using J-Com's SofTNC software with the BayPac packet modem?

Is it better than the BayCom V1.4 software included with the modem?

I'm using the BayPac/BayCom combo now with an HTX-202. Needless to say,
performance is less than ideal.

Should I invest $20 plus shipping from Ramsey for the SofTNC or
should I just purchase a real TNC?

Any comments or experiences would be greatly appreciated.

>That's today Ham-Radio ...

Speak for yourself...!
Some of us are quite actively building and enjoying our own radios.

One guy who works at another of my company's plants is scratch-building a high performance 6 meter station. A couple of the folks at my plant are into microwaves, and have built some of the 10 GHz transverter kits that are out there.

Me, I'm nearing completion of a scratch-built superhet 40m receiver, and am about to start on the companion transmitter. I'm later going to build a wide-band linear to boost any HF signal up to 25 watts minimum, for when I want QRO! I'm also considering converters to add other bands to my receiver.

BTW, I've never had a 5-second contest-style exchange on HF. I (and my wife, she's a ham, too) did work Field Day on 2 meter SSB.

Due to my poor english and a laps of memory I'll add something to my previous message:
About NSCC:
1) It's a board based on Z8530 and compatible (how much?) with other board like this (OptoPcScc, PI2 (?))

2) Software that can be used, and that I know, are: TFPCX, NOS/NET, Linux

3) All about this board will be PUBBLIC DOMAIN, in the ham spirit

4) I'll NOT provvide any part of the board, only all paper necessary

5) I havn't used PLDs so everyone could build the board (the reduction in number of ICs will result only in 1 or 2 pieces)

6) Next version, I hope, will use DMA

>and thanks for all ideas! 73's N0ZYA

HF packet, as presently done, is incredibly lame. I'd suggest you use
the AMTOR and RTTY capabilities of your PK232 for your live QSOs. For
mail and file forwarding, present day HF packet practice is just barely
acceptable, but for live contacts it's practically worthless.

It's well past time we abandoned our present way of doing HF packet
and adopt better ways of handling shared channel forwarding. AX.25
and its attempts at CSMA are insufficient at HF, and the Bell 103
standard modems are an abomination on the HF channel. The technology
exists to do much better HF modems using much stronger codings. And
we need protocols that are receiving station driven. A receiving
station can ask for a timeslice for its transmitting partner on
demand, and that can practically eliminate the hidden terminal problem
so endemic at HF if implemented correctly. (Since, by definition,
terminals hidden from the transmitting station are visible to the
receiving station, and since receiving and transmitting stations
alternate, each can alert the other's potential hidden terminals
to an impending transmission. Done right, this can allow all the
stations on the channel to negotiate a near optimum channel utilization
strategy.)

4477. Data compressoion over AX.25 links

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-10-06 00:00:00 UTC
From: gerry.g@ix.netcom.com
Message-ID: <4541nm$ni4@ixnews2.ix.netcom.com>
Source record: 41064

I am wondering if there are any standards of conventions regarding data compression over atandard AX.25 links, Also are there any regulations regarding this since the data may seem encrypted?

Much/most data is plain text which lends itself well to compression provided enough data is transfered to make building a dictionary worthwhile. Also, a standardized default compression dictionary would probaly work well on even modest exchanges.

I'm unaware of any such conventions in use but this seems to be an excellent way conserve a limited resource.

I can see a potential problem monitoring such traffic (for legal use). No station could reliably monitor traffic when a dynamic compression dictionary is used. Since a monitoring station can easilly miss a packet, the dictionary could easilly become corrupt at the monitoring station.

No, The D4-10 is here, too, and with a very minor mod, the TEKK as well.

>
> #2 Good T/R, Poor Response (According to Don, D4-10 and Tekk)

This is where most of the ICOM/YAESU/Kenwood/etc. stuff marketed an
'9600-ready' falls.

>
> #3 Poor T/R, Good Response (I suspect this group is empty)

This group is FULL: mostly older commercial stuff for 25+ kHz channel spacing.
The problem here is you have to tune it up (down?).
>
> #4 Poor T/R, Poor Response (Current "9600 ready" radios from Kenwood,
> Yaesu, Icom, Standard, Alinco, etc.)
No, this group is mostly the PLL-tuned voice radios of 1975-1990 vintage.

Hope this helps.

To throw another fly into the ointment, you also have to consider the radio's
power output: if 2W won't make it, what then??

You will do MUCH better with some of the new, very small GPS receivers.
Paccomm's new PicoPacket with built-in GPS would work VERY well for this,
not only can you get postion and altitude, but you can also get course and
speed, in real time..

Then, you can use the APRS software to track it.

If you contact Kantronics directly they should be able to
provide the Host information for the TNC's. I know that with the version
8.0 upgrade they provided me with a booklet on the Host mode.

This information is also included in older versions of the
manuals for the KAM (version 5.0 as I recall).

If you are sure about the COM PORTS. Try turning the TNC off
after starting Paket. Then turn the TNC back on. Check and see
if the letters RT are displayed on the screen. These will be bracketed
with a "happy face" and vertical double arrow. If this is the case the
TNC is in HOST MODE, try the
following...

Press CTRL-A followed by OHON (all caps) and end with CTRL-W. This
will should take the TNC out of Host Mode.

>some sorts, I have a KAM and would like to use it.

If you format the data into serial ASCII, then it can be fed into a TNC at the sending end, and received with another TNC at the receiving end. Many microcontrollers, e.g. the MC68HC11 or PIC16C71, contain both multiple-channel A/D converters and a CPU suitable for formatting the data just about any way you want. An advanced use of the microcontroller would be to format the data into HDLC UI packets per AX.25, eliminating the need for a TNC on the sending end. Kantronics used to make a box which had several A/D converters and an interface to a TNC, this is the 'no construction' method.

If you can afford to lose some samples, a one-way transmission using UI packets would do. In that case, the samples should be time-stamped. Using the connected mode ensures that all the samples will arrive (though data could overflow if the radio channel goes bad). An additional drawback of connected mode is that transceivers are needed at both ends rather than a one-way radio link.

>No, The D4-10 is here, too, and with a very minor mod, the TEKK as well.

The Azden is the only frequency-agile one, though. Most commercial mobiles
belong here too, with a possible (fairly simple) mod to ditch the phase
modulator and FM the transmitter crystal directly.

>> #2 Good T/R, Poor Response (According to Don, D4-10 and Tekk)
>
>This is where most of the ICOM/YAESU/Kenwood/etc. stuff marketed an
>'9600-ready' falls.

Has anyone published the T/R times of these radios? I was under the
impression they were hacked single-oscillator PLL jobs, which would have
poor T/R unless extroadinary measures were taken. They seem to belong in
group 4. I have not seen the major brands quantify T/R or response other
than the vague claim of '9600 Ready', which they are not.

>> #3 Poor T/R, Good Response (I suspect this group is empty)
>
>This group is FULL: mostly older commercial stuff for 25+ kHz channel
spacing.
> The problem here is you have to tune it up (down?)

Don is wrong here. Any radio with reed relays (or no relays) and
fixed-frequency crystal oscillators has the basic hardware to get <30 ms
T/R easily (maybe speed up an R-C constant here and there, maintain
constant DC power to the receiver, etc.). But getting good performance in
the ham bands may be difficult, especially if they are built for a far-away
'split' of the commercial band (such as 470-512 MHz). Always determine
that before buying. I would recommend surplus commercial rigs for

fixed-frequency installations where size isn't a problem, as they are much less expensive than the Kantronics or TEKK as well as having better front-ends and more TX power.

>>
>> #4 Poor T/R, Poor Response (Current "9600 ready" radios from Kenwood,
>> Yaesu, Icom, Standard, Alinco, etc.)
>No, this group is mostly the PLL-tuned voice radios of 1975-1990 vintage.

Which have been re-fitted with 'Data' jacks and re-marketed as '9600 ready'. In other words, the current crop.

>To throw another fly into the ointment, you also have to consider the radio's
>power output: if 2W won't make it, what then??

(1) Surplus commercial mobile (should have considered that in the first place). (2) 'Da Brick' (ordinary HT amplifier). Modify the amplifier so the PTT signal from the TNC gives it 'early warning' (i.e PTT from TNC closes relays in the amp immediately, rather than waiting for RF from radio), and the system T/R time shouldn't be degraded.

Wireless Linux Report

Earlier this year I got my copy of Caldera Linux. This is a very nice version of Linux, based on the Redhat Linux version. As a past user of Yggdrasil Linux, the installation was 99% bug free, much cleaner, but without source code for anything but kernel. The only thing wrong was that the version 13 image that you follow an option tree down to arrive at, had no ethernet. That wasn't too big of a problem, as I wanted to build my own kernel anyway. The CD has a text file in the image directory that better describes each boot image. Reading this, I found that image 16 (well I think that's what it was, but it's not important) was the one I really wanted. So read the manual, then read the text file in the image directory.

The next part was rather hard. I started looking for the AX.25 kernel stuff. (this version of Caldera is based on 1.2.28 Linux and AX.25 became integrated at 1.3.0 I believe). ftp://ftp.ucsd.edu/hamradio/packet/tcpip had some stuff in it. I tried the latest version there, but the utilities needed defines that weren't in my include directories. I then backed up a version (29 I believe) and arrived at something I could actually compile. I also downloaded some stuff from the UK site, but it seems to be older than what was on ucsd, or at least not the same. I finally decided to just use what worked, and press on, as I'm sure the next Caldera version would ve a version 3 linux (I hope).

I also tried the mkiss package, which tee's off of the serial driver to two pseudo-tty's, which are then attached to for interfaces. This was because I'm running a KPC-4 which has two radios multiplexed to one serial line. Alas, the mkiss program worked so-so, but then several problems arrived which made it undesireable and I had to delete it. The first is that while watching the trace, you see that the Kiss commands are adjusted randomly. I saw messages fly by saying that the txdelay had been adjusted. The killer came when during a heavy session, it got lost and randomly transmitted out the wrong port.

I'm now running one port using the standard axattach command. This works well and I've never seen an error. I have not yet got the netrom kernel stuff operational, but even if I did, I probably wouldn't use it. I didn't get in to TCP/IP packet to run Netrom :-)

The only network tool you can't use is ping. Ping will fire at a rate that is incompatible with 1.2k packet. I changed ping to oping, and created a batch file called ping that executes "oping -c 1 -s 16 $1". This sends one ping of 16 bytes to the participant.

After that I set up my anonymous ftp, several user accounts (edited their passwords to blank), and the Domain Name Server. I had planned to just use the /etc/hosts file, but I found that the sendmail never searched this file.

Here's what I use for my local area. K5JB (being a radical) likes to use the cray domain, so I pretend I'm the boss of that too :-)

---
```

With this I was able to begin sending mail to the local AX.25 network. Caldera also comes with an http World Wide Web server, so I used an editor to create a simple greeting. Using my Windows WG 3.11 box I am able to use my internet tools over the ethernet on the Linux box. I send all my wireless mail using the Eudora POP client, and Netscape to view my WWW page designs and ftp, etc. I did not install the X-Windows stuff on the Linux, as I wanted it to act as a server, rather than a workstation. I am in the process now of deleting all files that will never be used on this server, and uploading files that will. For example I'm looking at a couple SQL servers for database applications.

For routing, I use an MSS of 432, and an MTU of 280. What this does, is it sends two UI packets of size 256 to my neighbor node N0ELS. He runs JNOS under Win95 and has about five other applications running, and I don't want to overload his input. We mostly just send mail around here, so there is no need to pump huge data packets around. Norm (N0ELS) is my gateway, so I only need three route entries to hook me onto the local LAN:

```
route add owkie eth0
route add n0els mss 432 sl0
route add -net 44.0.0.0 mss 432 gw n0els netmask 255.0.0.0 sl0
```

(My router won't allow me to use n0els as a net gateway until I make a route to him first. I can later delete the direct route, but why bother...)

The way our local coordinator (Joe, K5JB) has set up the IP addresses, actually gives each user two IP addresses. For example my IP address is 44.78.4.2, but he gives everyone an even address, so that I can use 44.78.4.3 also. This 4.3 address is actually my Windows WG 3.11 box (which I also have X Windows Linux available on the second hard drive. This makes it easy for Norm (N0ELS), because he just puts in a route:

```
route add 44.78.4.2/31 uhf 44.78.4.2
```

This along with an ARP add for 4.2 is all the trouble he needs to put both of my ethernet computers on packet.

As an ex-JNOS user, I must say this settup is much more fitting to my needs. While I have thought about running JNOS on linux, I now conclude that running any DOS application on Linux is a bad idea. I tried to compile TNOS for linux, and found that after a day of error after error, that it wasn't ready for prime time. Looking at how the AX.25 kernel version runs, and how it interfaces to my home ethernet network, I am much happier and able to expand in many more directions. While I can't be a BBS like JNOS and TNOS, I didn't get in to TCP/IP to run a BBS.

FYI

I have found the 1.3.30 package with ax25-utils-1.3.30 to be quite stable (some
of the 1.3.x kernels certainly aren't!)

Use the -i parameter with ping. It allows you to set the rate at which ping
sends packets. ping -i 5 <hostname> seems to work pretty well.

Joe a radical? Come on, Steve!

Commenting out the OI entry in sendmail.cf will force the /etc/hosts file to be
searched, but only if the DNS cannot be reached (some of the hosts I contact
have obsolete entries, which has caused me a few missent messages. If I was
usnig my Linux box for radio only, I would try running named as an ampr.org
dns, however.

There is an application called LBBS. Also, a PMS is included in
ax25-utils-1.3.30, but I haven't been able to make it work correctly.

The Kantronics KPC-3 is the best bet for this, with all the features you name.
They are quite versatile and inexpensive. The beauty of it over the BayCom
device is that you can use your computer for other tasks or shut it down and
still be running with the internal firmware of the TNC and the radio.

It isn't the baud rate that kills HF packet, it's the packet
crashes, and the unwillingness of operators to avoid them
by QSY-ing away from the stacks.

I use a Kantronics KPC-3. Its inexpensive (around $125, last time I checked), tiny, runs off of internal power (internal 9 volt battery, you solder in the battery terminal) or externally (12 volts). Will handle AX25 or TCP/IP protocols. Will pass data at up to 1200 bps.

Hope this helps.

73,

Kelly Qualls

>lame. Does anyone know of any good software that will control the
>1278?
>
>Thanks,
>Jeff N2AEW

I use an older version(2.1?) of crosstalk. I redifined the keys so that,
for instance, shift F1 puts your MFJ1278 into HB 45,shift F2=HB 50 etc.
Most comercial com programs allow you to define the function key so you
can have up to 40 (f1,shft f1, alt f1, cntrl f1)....
I also wrote a basic program and compilled it with quickbasic(v4.5?).
I like it better than crosstalk, but (and I am not freaking out here) it
will not run on any thing higher than a 80286. It will not run on any
386/sx/dx or 486/sx/dx. It ran fine on my ps1(I must have had the only
ps1 with a serial card instead of the internal modem :) I only use my
MFJ1278 for RTTY,AMTOR/ASCII(and when I am really into pain)/cw. Of
course the only ASCII I have ever seen was W1aw(at least it works) I
use JVFAX for FAX and have received SSTV. Don't bother trying to
receive any image modes with the MFJ1278(the timing skew is a nightmare
and you might want to front mount the cpu clock trim cap (grin). JVfax
just blows the MFJ1278 out of the water. Even with the simple opamp
"converter" for jvfax you get grey scale reception. I have just
downloaded WXMAN 2.0 for the oakland ftp site.
Anyway, if want drop me an email and I will try to post/send my little
basic program to control the mfj(it is compilled for com1..I never
figured out how to use com3 or com 4). It only supports reception, I
never got around to completing the transmite section. Or you might
just try your hand at writting you own terminal program.

You're right that this isn't the same as the intent of the provision
for RC model control in the regulations (which is an authorized *one-way*
transmission). What we have here is telemetry and telecommand. Both are
permitted in the amateur service. For example, when you access a 2 meter
phone patch with TT commands, you are doing telecommand operation, and
when call status signals are relayed back to you, the repeater is transmitting
telemetry. These are perfectly Ok according to the rules.

Now there's a slight catch, if you are controlling a remote transmitter,
you're in auxillary operation, and have to operate above 222 MHz. So
while the remote transmitter in the robotic vehicle can transmit telemetry
on 2 meters, and you can transmit telecommands to the robot on 2 meters,
you *can't* control the robot's *transmitter* via signals on 2 meters,
because that's auxillary operation and has to occur above 222 MHz. So
you'd need a separate transmitter-receiver pair operating above 222 MHa
to maintain control of the robot's transmitter if you want to be legal.

There are a couple of exceptions. Repeaters can operate under automatic
control (until third party communications commences anyway) and packet
network stations can operate under automatic control. So if you're using
a packet link, you don't need the auxillary control link (though you do
need a safety timeout timer as in all automatic control situations).

In article <453bqt$c4k@hatch.sonalysts.com> gerheim@sonalysts.com (Al Gerheim) writes:
>
>It isn't the baud rate that kills HF packet, it's the packet
>crashes, and the unwillingness of operators to avoid them
>by QSY-ing away from the stacks.

Actually, it's both. The hidden terminal induced collisions are
a major problem, but so is too high a baud for the HF skywave
channel. Due to the multipath symbol distortion on HF skywave
signals, baud above 50 will suffer a very poor BER. Now the
baud of a signal and the bits per second of a signal *don't*
have to be the same. So you could still have a fairly respectable
bps while running at a sufficiently low baud. Clover does this
for example, using a basic baud of 31.25 but using symbol overloading
to support bps as high as 750. The common Bell 103 single bit per baud
signalling used presently for HF packet simply suffers too high a BER
under skywave multipath at 300 baud. It would have a much better BER
if operated at 50 baud, but because it uses no symbol overloading
that would also equate to 50 bps, and that's pretty poor throughput.
(FEC can help, but requires a good bit of overhead, and can be
overtaxed rather rapidly on a HF circuit being attempted at too high
a basic baud.)

If we want to reduce collisions, we need a different protocol,
or as you note we can QSY as long as a clear spot in the spectrum
is available. This negates much of the advantage of packet operation
however, since it is precisely because it allows spectrum timesharing
which makes it a better tool than things like AMTOR or Clover for
dealing with limited spectrum resources. If you can find a non-contending
channel, there are several methods better than packet for dealing with
the HF skywave channel, such as the above mentioned Clover.

Better encodings and modem designs help *all* digital modes, however,
by lowering the BER and reducing the need for retry requests. Just
increasing transmitter power is not a good solution for several reasons.
The first is that increased transmit power often makes the multipath
problem *worse* by raising the received level of more, and previously
weaker, multipath signals. And of course, higher power has the potential
to disrupt *other* communications near the channel.

We need desparately to adopt a more robust encoding than Bell 103
for the HF channel. And to keep throughput up, we need to go to
symbol overloading methods. And to make packet viable on HF, we
need better channel management protocols than AX.25. All of this
is available, in bits and pieces, already. All we need to do is

synthesize those bits and pieces into a coherent new packet
system for HF use.

Sounds simple, right? Well in principle it is, but the devil is in
the details, and getting operators to *changeover* to a different
method than what has become entrenched is difficult too. The latter
is why I keep harping on all this. If operators are *educated* to
the deficiencies of current technique, perhaps they will be motivated
to clamor for better methods.

>Thanks Russell

TAPR makes what you need. It's a small single chip micro that does
A/D (on several channels) and formats the information for packet
transmission. All you need to do is plug the box into the serial
port of a TNC. When you do a connect to the TNC, you command the
data to be downloaded to you. It's original purpose was for remote
weather telemetry, hence it's name, Metcom, but it also works fine
for any general telemetry purpose where you have an analog signal
that needs to be digitized and sent over a packet channel.

Hardware- standard modem cables work fine.

Software- Kantronics has a version of their software for the Mac as well. You can also use standard comm programs, such as zterm.

For most VHF stuff, I use zterm, and use the Kantronics HostMaster Mac for HF work.

Wireless Linux Report

Bob Nielsen (nielsen@primenet.com) W6SWE made some good points.

Linux Version Mania

> I have found the 1.3.30 package with ax25-utils-1.3.30 to be quite stable
> (some of the 1.3.x kernels certainly aren't!)

My own interest in getting a version 3 kernel resulted in a big waste of time.
I got an earlier version (maybe 29, I forget) and it was a huge download.
After that, the linux group came alive with reports that everything was broken.
The NFS didn't work, etc. Well, I can tell you, I certainly didn't think folks
could break so much stuff. The version 3 stuff is scary now, because the
people involved are not the same breed as in the beginning. They test about
10 minutes and call it functional...

Glad to hear that 3.30 is doing OK. I think I'll wait for 4.25 or so before
I download all that poop again.

Pinging below Mach 1

> Use the -i parameter with ping. It allows you to set the rate at which ping
> sends packets. ping -i 5 <hostname> seems to work pretty well.

Well I have to admit I never used that option. Most of the time I just ping
to get the route set up, and then send the mail. (although I don't really do
this much anymore, because I really don't think setting up the route first is
worth my time). But, I agree, the ping -i is probably much better advice
than I gave.

Sendmail Not Reading /etc/hosts

> Commenting out the OI entry in sendmail.cf will force the /etc/hosts file
> to be searched, but only if the DNS cannot be reached (some of the hosts
> I contact have obsolete entries, which has caused me a few missent messages.
> If I was using my Linux box for radio only, I would try running named as an
> ampr.org dns, however.

Here again I admit to missing this option in the file. I knew there was some
way to do it, but I must have really wanted to tackle the DNS pretty bad :-)
Actually I like the DNS, and I probably would consider my /etc/hosts an old
fashioned way to go.

Regarding JNOS BBS

> There is an application called LBBS. Also, a PMS is included in
> ax25-utils-1.3.30, but I haven't been able to make it work correctly.

No thanks. I'd probably spend more time on my INN. I've almost got it
working, but I think one of my shared libraries isn't right.

You can have lot's of fun with this one! I did once in the past.

If you are interested in maximum radiation broadside to the
plane of the window and can tolerate a fairly narrow beamwidth there
are several curtain style broadside arrays which are easily fabricated
from wire or burglar alarm tape and attached to the window. Without a
reflector they will radiate as much inside as outside but this may
not be a problem. If it is, you will want a reflector spaced one quarter
wavelength behind the plane of the array. The reflector can be as little
as a series of vertical wires allowing some use of the window or can
be a solid conductor. Another antenna I have had good luck with
in a window mount is a 2 bay array of double extended zepp's fabricated
and phased with magnet wire tacked to the window pane with clear bathtub
calking. I suggest using 300 ohm twinlead for the feeder and a good
quality 75:300 ohm balun for the conversion to coax.

Phased arrays are pretty easy to design and feed and are a good choice
if you don't have good measurement equipment and don't know precisely
what the effects of surrounding objects are going to have on element
self and mutual impedances. Small grain of wheat lamps can be useful
for indicating current at UHF and if left in the system are rather
colorful to watch!

The ARRL antenna book has a pretty good section on phased broadside arrays
which can be adapted to windowpane mounting once you abandon the
coax fed yagi or groundplane paradigm.

Email me for more suggestions.

The Kantronics KPC-3 is the best bet for this, with all the features you name. They are quite versatile and inexpensive. The beauty of it over the BayCom device is that you can use your computer for other tasks or shut it down and still be running with the internal firmware of the TNC and the radio.

Subject: Do you use technology in your club? Please Read.....

I have been asked to research how different amateur radio clubs make innovative use of technology to communicate to, and with their members. I have volunteered to research this issue for the Montgomery Amateur Radio Club in Maryland. My goal is to present a report to the membership on how others are using packet, the internet, BBS services, voice mail, and even programmed repeater announcements to keep the flow of information in front of the members. I feel strongly that the time has come to consider the club newsletter as only one vehicle for the dissemination of information. Your comments are appreciated. If you are a member of a club, please share with me what your club does, or what you wish they did do.

When all responses are compiled I will make the total file available for anyone who wishes to see it.

Thank You.

4508. How to Get Free Cable Premium TV .. LEGIT

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-10-07 00:00:00 UTC
From: md@goodnet.com
Message-ID: <DG2vI3.3t5@goodnet.com>
Source record: 41095

First I want to say I am sorry that this has nothing
to do with the topic of this group. You may see this
message in other newsgroups, the reason is I am subscribed
to those too so please don't flame me. I have been posting
and reading to this group for a while. I just wanted to
let you people out know there is a way to get Cable TV for
FREE. I recieve this letter in the mail from a friend
that had told me it works. I gave this to one of my friends
and he had free cable in his house within 20 mins. I have not
tried this method yet but may soon try if my cable goes up in
price. If anyone would like a copy send the following to the
address below.

Address Envelope to:

FreeStuff
9393 N. 90th St.
Suite 102-289
Scottsdale, AZ 85258

Enclose in the envelope:

Send...

$1.00 U.S MONEY *** NO COINS *** NO CHECKS ***
inside a sheet of carbon paper or construction paper,
and send a *self-addressed*,*stamped* envelope to the
address above.

Thanxs,
Just think if you pay 30$ + a month. 1$ will save
you 359 + dollars a year.

In article <1328@heart_talk.win.net> editor@heart_talk.win.net (Ronald J. Bowden) writes:
>Does packet radio offer anything even near to what landline
>BBSs offer with PBBSs? Is there reliable connection at
>faster speeds then 1200?

YES! Packet speeds of 56 kb are available via the WA4DSY (aka GRAPES)
56 kb RF modem. While the typical packet BBS is no more functional
than a telco PBBS, packet allows full network functionality, similar
to that offered by the internet, when fully functional protocols
like TCP/IP are used.

Of course, as is the case with landline PBBS systems, *both* ends
have to run the advanced modems and protocols for anything to happen.
This is the biggest drawback with VHF/UHF packet, you're constrained
to the lowest common denominator on the channel. If the retro set
insist on using 1200 baud, then you'll be stuck there too.

Gary

Good topic. Compression techniques can be valuable for conserving
channel time and capacity. We're allowed to use such techniques
when their intent is to facilitate transmission, not to obscure
meaning. That means we need to either use well known methods,
or keep records of the methods used so that enforcement authorities
can check on what we've sent if they suspect illegal activity.

Times are tough for those attempting to monitor, unconnected,
the transmissions of stations operated in connected modes.
Compression can make this more difficult. But it's not our
purpose to make the job of the eavesdropper easy. It's our
purpose to move our data in the most efficient possible manner,
and compression can be an assist to that.

Dictionary compression on block data, such as the common zip
methods, can be highly efficient, but aren't really well suited
to on-the-fly stream compression of short interactive messages.
Simple minded techniques like run length encoding can work on-
the-fly, and offer a modest compression advantage, while still
allowing the eavesdropper to resynchronize after a missed frame.
A standard dictonary also has merit for this application.

I'd suggest we need to look at two different compression needs.
For bulk data, sent as a large block, the methods we use on
our hard disks for compression are suitable, IE just send zip
files. For interactive use, we need a stream compression method

which cannot a priori analyze the complete block to build a compression dictionary. I mentioned simple minded run length coding, but modern telephone modems use more advanced stream compression methods based on dynamic dictionaries that are much better. Ideally, any message can be expressed as a single Godel number. That would be the ultimate in compression. I don't think we have the computing horsepower to do that yet, however.

>IBM compatible only. Any basic help will be appreciated.

Most communications programs suitable for use with an external telephone modem will also be usable with the KAM. Red Ryder comes to mind for the MAC, just as ProComm comes to mind for the PC. The basic criteria is that the program have a "local" mode, for use directly connected to another computer, or allowing direct keyboard "AT command" level interaction with a modem. Terminal emulation isn't important, though the ability to operate split screen is nice. But glass TTY emulation is sufficient to work with a TNC.

Cabling should be the same as for a telco modem. You may need to jumper DSR active all the time to control the TNC in command mode, depending on the comm program you select. Better programs can be configured to ignore these out of band signals and will work with a simple three wire connection.

Any idea how they avoid legalities regarding encrypted messages? I am thinking of compressed packets embeded in an AX.25 packet. Not unlike YAPP transfer of a ZIP file. If anybody monitoring misses one packet they won't be able to unZip it.

I'm aware of patents/copyrights but there are public domain methods.

4515. Packet BBS & Telephone Modems?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-10-08 00:00:00 UTC
From: hmm@netcom.com
Message-ID: <hmm-0810951144160001@198.0.2.1>
Source record: 41102

I have asked this before, but as I am learning more and more about amateur radio, I am wondering - what are the legalities involved with running a packet bbs which allows users to post messages publicly (all hams).

And, to go further, what about if that bbs had land line modem access. What are the legalities of that.

I have heard that this is covered under third party traffic.
Is that true?

4516. Any packet channel statistic pprograms ??

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-10-08 00:00:00 UTC
From: n2czf@gate.net
Message-ID: <457niv$3fq@news.gate.net>
Source record: 41103

Hello I am looking for a program to monitor a specific frequency (packet) and print out a screen or file that will give me all of the
important information of the channel usage.

I have FTP'ed MONMAX.ZIP from the TAPR WWW site but it seems that the program does not work. Certain things do work in
the package of about 5 sub-programs but the important ones that total the raw data and the one that converts it to a file that can
be read by a spreadsheet to create graphs do not.

This must be a PC based system (I know of a good one but for the MAC) and that is about it. I am trying to make a point in my
local area of what problems too many digi's and beacons can do to a frequency. Some locals are using UI Beacon frames
(APRS program) in a 3 or more hop path while others are placing digi's with the same ALIAS about 10 miles from each other with
the SAME coverage area. I just hate to see the frequency become like all the others where a packet can't make it thru and
where packet just becomes RACKET! If I get some hard facts on the problem maybe some of the people will re-think their
position and go about differently on how they use the network.

Thanks for any help and please E-Mail any information or file ATTACHMENT to n2czf@gate.net

>>It seems to me that forwarding over internet - or other
commercial/educational
>>or governmental network has nothing to do with amateur radio.

I think the above statement is like saying what do phone lines have to do with computers.The world is changing. The technologies are becoming integrted. Ham radio can adapt to the change or wither and die.

Perhaps one of the strongest reasons to link digital amateur radio to the internet is as a means of conveying information in the event of an emergency.

Recently there were devastating hurricanes in the Caribbean. News from St. Martin was first broadcast by marine single sideband. From there it was relayed by pactor to a Florida station which was able to put it on the net. The whole idea was to make the news available to friends and family of those who were in the disaster area. Had the information not been put onto the internet it might have floated around in ham circles and not been properly distributed to people who needed the info. Ham radio played an important role. So did the Net. Neither could have worked without the other.

I spend half of every year as a aboard a boat. My hf packet rig is my primary tool for communicating with people who are important to me. Many of my friends are hams, but as I am sure is the case with the majority of us, most are not. Packet/internet gateways provide me with a means of communicating with non-ham friends.

Ham radio, after all, is a hobby. We have many creative and inovative people involved. I am greatful to the pioneers involved with linking packet to the net.

"The times, they are a changin"

Depends on the wording of your licence. The UK licence distinguishes
between encoding to facilitate transmission and encryption to prevent
others using it. Of course, there is a very fine line between the two
and abuse of the system would no doubt lead to its withdrawal.

yep... Works great (well, it works as well as we've all come to expect MS products to work)

I use ethernet cards to hook my windoze95 box to a cheep and dirty 286 box. The 286 runs a stripped down version of NOS that is really just a router. With the use of 'arp publish' my 286 will answer any arp requests for the windoze box. With old 286 boxes costing about the same as a tnc or less this is a simple inexpensive setup.

This is what I have been saying. A gateway on St. Martin wuold have been useless, just as the gateway a mile from my home would be useless if there were a major disastor here. But we could relay traffic via RF to the nearest gateway and jump it on the net there so that it could travel faster. The whole idea is to get the information to where it needs to be as fast as is possible. I don't care if it starts out as a 1wpm smoke signal, it should reach maximum speed as soon as possible. Copy that smoke signal, CW op, voice op, 300 bps HF packet, whatever then speed it off to its destination. If that means giving it to a non-amateur for delivery, so be it. But time is what is important, especially if you are the on waiting on information about you loved-one in the danger zone.
If my family had been there, I would have preferred to have heard from a fellow ham that they were alright, but I mostly would just have

wanted to hear that they were alright.
There is a need and a purpose for both packet and the internet. They
can share and benefit from each other. We have the advantage of being
able to run with very low power requirements and almost no infrastructure
left intact by using mobile and portable equipment. The internet has
the advantage of being connected almost world-wide and fast over a great
distance. Why argue about them?
It seems to me that many hams aren't happy unless they are arguing:
CW vs. Voice vs. Packet vs. Internet vs. no-code license vs. ....

Hello all-

I seek advice: My wife and I are a couple months away from getting our licenses (going for tech) and are just learning about amateur radio. Here in Seattle (Redmond, actually) Icomm is holding a BLOWOUT CLEARANCE SALE of discontinued models and used gear. I'm looking for a mobile 2m for my wife's and my 1st rig.

While we both know the shortcomings of discontinued models, and neither of us know enough about radio to get a reliably good used piece of equipment, I thought we'd go look the sale over and maybe even get something if it was in the $200+ range.

Comments? Warnings? Is Icomm worth what you pay for it? Will it sour us on ham forever?

The sale is this weekend (14 Oct) so hopefully I can get some words of counsel in time to either save or wisely deplete our bankroll.

TIA
Harley and Barb Tuck

Hello,

I was just wondering is this possible? I have a collins S series station
is it possible to set it up to run Packet? I know there is a keying issue
but asside from that it sounds like it should work, at least theoretically?

Any help on the subject is greatly appreciated.

Thank You
Stephan

Can anyone please help me?

On the weekend of October 21st the Scout movement is involved in the Jamboree On The Air (JOTA). We at the Phoenix Venture Unit (Kenton & Kingsbury District) North West London, had arranged for a licenced radio operater an a few of his collegues to use our Unit Den as a base for a radio station. We have made all the arrangements for masts and wires to be strung for aerials telephone lines etc. but he has just been given the completion date for moving house and it is that weekend, therefore we are without a licenced operator. Is there anybody or a radio group that would like a change of venue with opportunities for new contacts that would be willing to help us out, time is of the essence with regard to arrangements and licences etc. If you can help or require any further details please reply asap.

: Actually, it's both. The hidden terminal induced collisions are
: a major problem, but so is too high a baud for the HF skywave
: channel. Due to the multipath symbol distortion on HF skywave
: signals, baud above 50 will suffer a very poor BER. Now the
: baud of a signal and the bits per second of a signal *don't*
: have to be the same. So you could still have a fairly respectable
: bps while running at a sufficiently low baud. Clover does this
: for example, using a basic baud of 31.25 but using symbol overloading
: to support bps as high as 750. The common Bell 103 single bit per baud

Hi Gary.

What do you mean by symbol overloading? Multi-level signalling perhaps?
(like if a bit can have 4 levels instead of 2, you can transmit a byte
in 4 bits) or do you mean having the same "symbol" represent more than one
character, and using shift characters when necessary?

Hello !

When modulating a PLL with digital signals problems frequently
arise with loop parameters as regards low frequency response
of PLL.
Has anybody experience with simultaneous modulation of loop and
reference crystal ? Also any hints to appropriate literature are
appreciated.

Thanks from DJ9HH

>in the cW and RTTY modes. Anybody have a similar mod?

It is a pity that you can not just select that filter for "SSB narrow".

With my IC-736 I am using following trick when QRM requires 250 Hz filter:

KAM: Mark 700, Space 870
IC-736: Split, VFO A : CW-N at QRG, VFO B: LSB at QRG, DeltaTX: 800 Hz

The only drawback is that you have to remember to press "Split"
a couple of seconds and hold XFC while selecting LSB every time
you QSY.

4546. Data compression over AX.25 links

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-10-11 00:00:00 UTC
From: EFBRYA@acxiom.COM
Message-ID: <e9a8e180@acxiom.com>
Source record: 41133

In regards to finding a compression mechanism for AX.25 might I suggest zlib? It is avaialable in C source and can be used as stream or block based. The code is "copyleft" and some work has been done to keep the patent problem away. (This is no guarantee as the .gif format showed.) The source is fairly well documented and portable.

http://130.217.240.12/~singlis/compression-pointers.html

has pointers to this and other methods.

4547. Local Positioning System

Newsgroup: rec.radio.amateur.digital.misc

Message-ID: <e9a919f0@acxiom.com>
Source record: 41134

Keith Sproul suggested using GPS for position control for an R/C helicopter:

Won't the accuracy of GPS be to low here? He could do differential GPS by comparing with a unit on the ground at a known position but the drift of +/- 100+ meters on a single GPS would cause problems unless he has a VERY large empty flying field.

I am not sure that altitude can be done accurately enough by either means (triangulation and GPS) as the last 5 feet are what really matters. You could try an ultrasonic system on the bottom of the helicopter for this.

For example, quadrature phase shift keying.
2 binary data streams. Stream I 1=0 deg. 0=180 deg. Stream Q 1=90 deg and
0=270 deg. By shifting the carrier about 4 different pahse relationships,
each position can mean any 1 of 4 different data combinations.

Effectively at this point, the baud rate is 1/2 the symbol rate.

With methods such as Clover, you can run a very solid (apparent) 200 bits
per second on HF even though the actual baud rate is 40-50 which is the
optimum value.

|> Subject: The use of BPQ over ethernet Using NDIS instead of IPX/SPX.

Use your NDIS<->packet driver shim.

FTP to ftp.intel.com (I think) and grab the packet driver version of
IPX.COM. I think it's called PDIPX (or IPXPD :-).

Run NDIS in REAL MODE (NDIS 2), this is configurable when you install
WfW TCP/IP or using the network setup panel.

Load in this order,

NDIS 2
Packet Driver shim
PDIPX
BPQ Ethernet driver
BPQ code
Windows

Good Luck,

Carl.

Greetings all. I am trying to find info on both the NMEA-0183
spec and the interface used by the 'Magellan Trailblazer' GPS reciever.
Acording to what little data I have the 6 pin plug is dc 11 - 13vDC with 4
pins for data. trans data, rec data, signal ground and ???. Also
what standard does this unit use? ttl?, psuedo ttl?, or rs232 like the NMEA
spec calls for? Any info would be great. Thanks

Have you actually tested this? (sorry to ask).

The bpq ethernet module communicates directly with LSL, it doesn't use
IPX at all. Does pdipx provide the LSL connectivity?

You only need:-

LSL
ethernet driver
ODIDRV xxx
BPQCODE
and so on.

LSL acts as a packet switch to the ethernet driver (ie as a standard
interface, very similar in concept to bpq itself w.r.t. to its
interfaces). The ODIDRV program is multicasting the level-2 packets on
the ethernet. The format of the packets are:-

short length_of_data_in_this_ethernet_packet
char [5] internal_bpq_data_and_some_useful_flags
char [14-400 odd] the_level_2_frame

The length is there because the size of the ethernet frame won't
necessarily (and if it is less than 60 bytes, it won't) be the same
length as the level-2 frame + 5 bytes. It is in little-endian format.

The format of the 5 chars of bpq internal data is as per the raw read in the host.doc file.

To use NDIS efficiently would require someone to interface to NDIS in much the same way as ODIDRV currently interfaces to LSL. In principle it isn't very difficult. I have Linux routines for doing this, which are useful only to connect user mode tnc emulators (ie it doesn't provide kernel level ax25 connectivity - someone else has done this in the latest kernels I believe).

Robert,

Don't dispair, although difficult, it can be done. Last year I got into
a competition with a fellow ham on who would be the first to connect
to MIR. We limited our power to 5 watts on packet and worked hard
on many passes. I finally got a solid connection to MIR with my 5
watt HT packet station. My antenna was a no gain Radio Shack Discone
at 25 feet fed by lossy RG-58 cable. (talk about stacking the deck
against myself!)

Keep trying!

I think the 4.42261 Mhz is a common value, I got one without problems from a
local store and it was cheap too.

About TCM3105.zip, there are some flaws in the schematic. These are:

1) D2 shouldn't have been connected to CTS, it should have been in the TXD line!
2) There are two R3 resistors and R2 is missing. The resistor on the CTS line
should be R2.
3) Due toe R14 I didn't get any sound of the modem, but that may be due to
my trancseiver.

I see a lot of posts about building 'the' Baycom modem.
harumph.
I have schematics for at least three different Baycom modems.
They use the TCM3105, mostly, but the circuits are a lot different.
I had, but cannot now find, a Baycom modem schematic using the
7910 modem IC. Since the modem for the C-64 is about the same,
it would not be hard to create that one.
One commercial Baycom modem I have used is the one from Tigertronics.
It was not critical to tones, it was critical to audio level.
It just worked perfectly on three different radios with no changes.
It is just that the software (I bought version 1.6) was really
awful. The Commodore 64 software (Digicom whatever version) is so
much more sophisticated. You can run the C=64 system as a small
BBS. Try doing that with Baycom.

This posting is for a good friend in San Antonio, Fred W5QJM.

His Icom 22U (yes U) was ripped off on 9-Oct-95. If you happen to see a posting for such a radio with Mic and power cord, Fred would appreciate a call. He can be reached at 1-800-456-7411 (ex 7304) or FAX at 210-828-1627.

>experiments, but they could be troublesome when implementing something
>in a commercial box, or when putting software up for general distribution.
>
>Most compression algorithms are covered by patents.

Actually, the *good ones" are covered by patents but there are plenty of alternatives available too that aren't quite so good and aren't patented either.

AX25 was invented in a world that is now surprisingly distant. AX25 packet was designed for dumb terminal access. In the past few years, that is pretty much a thing of the past. Everyone uses some kind of PC (generically including Mac, Amiga, Unix). In such a situation, many kinds of compression - even simple word substitution, would be effective for AX25 BBS work.

In a related vein, our process of point to point links of AX25 packet at slow 1200 bps levels is absurb. We are abusing the spectrum! We should be looking at broadcast like teletext functionality. Have your PC constantly sniff the stream to get what you want. Effectively, you turn on your packet s/w and all the interesting messages are "instantly" available because they've already been sniffed out of the air by your PC.

Multicom goes beyond lame. It's about the worst example of
an 'all elbows' 1984 vintage DOS program that I've seen in
a long time. Yuk!

I can't believe they have the nerve to put this out with
an otherwise good piece of hardware. I'm calling MFJ
to see if there's any hope for a REAL windows program.

What I'm interested in is something that will work with
the MFJ1278 for slowscan. The Multicom stuff is not only
a pain to use, but it does a horrible job of converting
any pcx to a decent looking S1, M1, or any other format
sstv image.

In article <45er79$n25@news.asu.edu> rutledge@imap1.asu.edu writes:
>Hi Gary.
>
>What do you mean by symbol overloading? Multi-level signalling perhaps?
>(like if a bit can have 4 levels instead of 2, you can transmit a byte
>in 4 bits) or do you mean having the same "symbol" represent more than one
>character, and using shift characters when necessary?

The latter is an example of character set compression, and while useful
on occasion, isn't what I'm talking about. What I mean by overloading
is that one transmission symbol represents more than one bit. The classic
example is QPSK. Each symbol represents a dibit, IE two bits. So that
for 1 baud (symbol/sec) we are actually sending 2 bps. We can generalize
this out to any degree of overloading we like, and call it m-ary transmission.

QPSK is particularly attractive, however, if we Gray code it. That way
it is antipodal, and gives us the same Eb/No as BPSK while doubling
throughput. (Antipodal signalling puts the two states for a bit the
maximum distance apart in signal space. This allows us to form a
maximal likelyhood decoding decision based on the minimum possible
Hamming distance.)

Assume that I is encoded with the first part of the dibit and Q is
encoded with the second part of the dibit. An example Gray coded
constellation looks like this:

```
Q

+(01) | (11)+
|
|
I -------------------
|
|
+(00) | (10)+
```

Note: I've taken some liberties with the cartesian axis above.
The crossing point has been offset to 1/2,1/2 for clarity.

Note that the I bits are the maximum distance apart in signal
space, and the Q bits are similarly the maximum distance apart.
Symbols are antipodal along both diagonals. When the transmission
symbol makes a single transition from one dibit position to
another, two bits are transmitted. The likelyhood that either
bit is in error requires the corresponding distance vector to
traverse the maximum possible distance, so error likelyhood

is minimized.

BPSK would correspond to just an I vector, and thus only encodes
one bit per baud while giving the same distance metric in signal
space as QPSK. For the same Eb/No, QPSK transmits the same information
as BPSK in half the bandwidth, IE for equal information transfer,
BPSK would have to run twice the baud, and occupy twice the spectrum,
of QPSK. That's because QPSK overloads its symbols while BPSK does
not.

Other m-ary transmission encodings can have a greater degree of
overloading, but require a higher Eb/No because they can't be
made antipodal, and thus the signal space distances are less,
and stronger signals are needed to differentiate them from each
other when corrupted by noise.

OOK only transmits one half of the 0,1 pair, so its signal
space distance is 1/2 that of an antipodal coding, and its
performance in AGWN is 3 db poorer. (And that ignores issues
of coherent decoding, which adds another 3 db over incoherent
OOK at first order, and ignores more advanced signal codings,
such as trellis coding, which spreads the signal space over
a *much* larger area, and can offer gains of many db under the
proper conditions.)

Gary

I'm try to put up an Internet gateway with a 1.1.59 Linux box and am running

KA9Q NOS version 911229 (WG7J v1.09a4-Unix)

I have JNOS connected to a TNC through a serial device and to Linux
Internetworking support through a PTY Pseudo-SLIP connection.

I find that JNOS crashes on the telnet after SMTP does something and at
other odd times. If I need to dive in and fix the source, I will, but I'm
wondering if somebody can point me to a more stable binary.

I don't want to do anything unusual, just telnet and smtp.

For those interested, I talked with 'Tom' at MFJ technical support about Multicom. (1-800-647-8324) He was VERY helpful and agreed that Multicom was lacking as
far as windows compatibility and that they were in the process of doing a rewrite. Should be out about Christmas time.

They also have a new product - MFJ1213 that is an interface for use with JVFAX70 for slowscan, fax, etc. He verified what I had experienced. The UA741 op amp circuit that is touted in a lot of articles as a simple interface for JVFAX and other programs is a real bear to get working correctly. I spent a week of frustration building and rebuilding that circuit to no avail. The MFJ1213 is supposed to list for $29.95 and will be ready for shipment in about 6-8 weeks.

For Sale: Mint Japan Radio NRD525. 0-30mhz receiver, notch filter, pass band tuning, 200 memories, etc. A great desktop unit and lots cheaper than the new 535, which isn't all that much different. $675. Have box, manual, etc. Has seen little use.

Also for sale: CFL232 0.5KHZ xtal filter
CFL233 1.0 KHZ xtal filter
NVA88 speaker
all genuine JRC accessories

Asking $50 each item. Will sell with receiver or separately.

PACKAGE DEAL: Above radio (without accys), with KIWA MAP unit $800. This is the KIWA sync detector and audio stage made especially for the JRC525. Gives the 525 all the advantages of the newer 535, and better audio. Looks like a JRC speaker. KIWA unit alone was $275 new.

Please E-Mail if interested. Need to sell! Thanks.

Hola a todos:
El Digigrup "JAEN" est&#65533; montando unos modem
basados en el
conocido integrado 3105 que funcionan perfectamente a traves del
puerto serie.
Es ideal para hacer correr los conocidos programas SP (SKAY PACKET), GP
(GRAPHICS PACKET), BAYCOM e incluso TPK.

Es posible hacer tambien funcionar el modem conectado al puerto
paralelo del
ordenador.Para ello es imprecindible que el programa residente TFPCX se
cargue
con el par&#65533;metro -PLPTx (x es 1 &#65533; 2, seg&#65533;n el puerto paralelo
utilizado).
En este caso la alimentaci&#65533;n del modem ha de ser exterior.

Los interesados en dicho modem pueden hacer sus pedidos a:

DIGIGUP JAEN

ftp to crompton.nadc.navy.mil and cd to /pub/hamradio/packet/wa3dsp

j108dfd is the version that I currently run. And Doug has done a lot of
work to fine tune and adding features. (Like real unix directory looks).

In fact, it is running on a 12 MHz At right now. Stat says its been up
and running, 55 days 13 hours. And free memory of about 70K or so.

Hello,

I have asked this question before but have lost the notes I made from replies, sorry.

I have ETHRAX25/WINPKT/TRUMPET/Mailers/FTPers/POPers/TELNETers/etc.

How does all this connect (software wise) to my MFJ1270B (currently TINY2 as MFJ getting 4800 modem fitted)?

I was able to load ethrax25/axconfigure_program/winpkt and then when TRUMPET was loaded watch data fly by when TRACE options where marked! However, it was all in HEX and no callsign/ip_address where to be seen. Like wise, I was not able to access the outside world via the IP services available on my machine.

System is....

386SX 25 MHz 4MB RAM
Windows4Workgroups v3.11
DOS 6.22
QEMM 6.02

JNOS 1.10l functions flawlessly under Windows.

Any help appreciated.

: Amateur Packet TCP/IP?

Yes. It'll work fine for Amateur TCP/IP since it is fully compatible... that is unless hams do as they usually do and try to reinvent the wheel and come up with their own non-standard standards. Mobile-IP is already well thought out and takes into consideration much of what packet deals with. I'll be supporting Mobile-IP soon.

Yes but I admit I was using the 30 watt amplifier from Radio Shack. My setup is a HTX-202, Radio Shack 30 watt amp, Kantronics KPC-3 TNC, Discone antenna that is used for both 70cm and 2m via a duplexer. I've only made one contact but it was fun.

>I have asked this before, but as I am learning more and more about amateur
>radio, I am wondering - what are the legalities involved with running a
>packet bbs which allows users to post messages publicly (all hams).

That's cool, almost all packet BBS systems allow that. The FCC considers ham packet BBS systems as message store and forward systems. The originating station operator for the message and the first forwarding BBS station operator are considered primarily responsible for the content.

>And, to go further, what about if that bbs had land line modem access.
>What are the legalities of that.

That gets trickier. If dialup landline access is permitted, then messages introduced from landline callers have to go out under the call sign of the BBS owner, as third party traffic, since the BBS station is now the originating station for the message. It doesn't matter whether the callers are hams or not. *Their* stations are not originating traffic on radio, so the BBS isn't acting as a store and forward system for packet traffic from them under FCC rules. Instead it is acting as the originating station for third party traffic.

Wormholes are an exception. If traffic originates from an amateur station, is picked up by another station (first forwarder), and relayed by wire to another station which retransmits it on radio, then the wireline link doesn't change the second forwarding station into an originating station. Wormhole operation is no different in principle from split-site repeater operation where there's a phone line linking receiver and transmitter.

The key issue is, what station *originates* the traffic? If it's the BBS station, then it's either first party traffic, if it's from the licensee of the BBS station, or third party traffic if it is from any other party using the BBS station as the origination point. But if the traffic is received by radio from another station, then the BBS station is merely acting as a store and forward relay and that traffic isn't considered a third party origination by the FCC.

This area can get subtle, like how many angels can dance on the head of a pin. If we said that third party traffic consisted of *any* content retransmitted for a person other than the licensee, then ordinary repeater operation would be considered third party activity. But it's not. The *reason* that it is not is that third party traffic has to be *introduced* to amateur radio for a third party by an amateur station. So, for example, if an amateur lets

another person speak on his radio, that's third party, or if a repeater station *introduces* a third party by phone patch, that's third party, but ordinary relay of one amateur station by another is not third party.

Bringing this back to landline access to an amateur station, it's no different in principle from phone patch operation. Messages posted by people from the landline are third party content originated by the BBS station. Messages relayed from other amateur stations, even indirectly via wormhole, are not third party beyond the first forwarder (as far as the relaying station is concerned, though they may be third party to the originating station).

Since all third party traffic must be under the direct supervision of a licensed control operator, BBS systems allowing phone line access must be *manned*. BBS systems acting merely as store and forward systems for other amateur stations do not have to be manned. They can operate under the FCC automatic operation rules.

A couple of notes. Operators don't have call signs, amateur stations do. The FCC regulates transmission by amateur stations. So just because Joe Blow is a ham, he can't originate a message via landline under his station's call sign, because his *station* was not involved. Instead, he has to act as a third party under the call sign of the station actually originating the traffic.

Side note, of course if he is *controlling* his station by wireline, then he can originate messages under his station call sign. This is just remote control operation, and falls under a different part of the rules.

This is what the Pacsat protocol does. It's fine for bulletin
transmissions, general file downloads, etc, but is rather wasteful
of spectrum for transmission of messages intended for only one
recipient. That's still better served by point to point transmissions.

The easiest way I found is to use the FCC's fax-back service, you need a fax machine or fax-modem # to give to it.

Call (202)418-0177, ask for form #000610 & give it the phone # to send it to, it calls the # in a few minutes & sends you 3 pages, unfortanatly you have to mail it back to them. Good luck.

Needham Electronics makes avery good EEProm reader and burner. I don't know if that is exactly what you want, since an Eprom can be used only once, the EEprom being the one that can be reused. Anyway, I bought mine from them for about $150.00. I don't remember the address offhand, but I have seen their ads in various electronic and ham radio magazines. If you are into building projects, many of them use EEproms and make the source code available. Then, all you have to do is grab the source code, load the program and burn the EEProm. Oh -- one other thing -- the one I bought requires a PC slot. It is really simple to use, and really handy for off the wall projects.

Michael...

The software that came with my KPC-3 was a little terminal program called PACTERM. It works, but barely.

If you have a good modem program like Procomm-Plus, it will work with your KPC-3. It will also be much more user-friendly and powerful.

There are several other programs on the market that are designed for the Kantronics line specifically, but I haven't used them.

Until I recently changed TNCs, I was using TPK (in conjunction with the local BBS using F6FBB software) as my terminal program.

Have fun..

Subject: Re: Packet Door for BBS ??

DK>Does anyone kno of a packet program that can be used as a door
>in a MSDOS based BBS ?

YES!!! ARPD124.ZIP - the Amateur Radio Packet Door v1.24. Available on
ATTENTION to Details BBS at 909-681-6221.

From your Users' standpoint, operation is very simple. Just set it up
as a Door, wait for the program to initialize the TNC, and they operate
it just as if they were using it from their computer.

You may also use the door while logged on to the BBS locally,
just as any user can.

ARPD is well written. Ease of operation was a prime consideration - as
was low Sysop maintenance. Once installed, ARPD requires little
attention. All operations are handled automatically by an intelligent
operating system requiring little specialized knowledge on the
part of the SysOp or the user.

When a user accesses the door, the call sign of the TNC is changed
to that of the user. This allows him to log on to packet BBS
stations and receive traffic as he would from his own home station.
The call sign is changed back to that of the System Operator on exit
from the door. This has an added advantage of making the user
responsible for his own actions on the air.

PLEASE use some sort of APPLICATION with your Users in order for them
to access such a Door! AND - you should have a photocopy of their
Amateur Radio Licenses at your station. I'll post my Application as an
example, if you would like.

4598. Re: Merging BBSs and the Internet (was MSYS ...)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-10-16 00:00:00 UTC
From: rutledge@imap1.asu.edu
Message-ID: <45ul59$hm4@news.asu.edu>
Source record: 40893

: It can be made to work, though, if people agree to cooperate. Internet
: domain based addressing works just fine over UUCP for both mail
: and news. UUCP is a store-and-forward network just like the current BBS
: network. Given a scheme for distributing the routing tables we could
: merge the functionality of Internet domain addressing with the
: AX.25 transport layer in a seamless manner, providing better connectivity
: for all (and that's what ham radio is all about).

But UUCP is mostly frowned on as an obsolete protocol isn't it? You seem
to think it's better for the amateur mail-forwarding application than
whatever is the current protocol. Why? In fact, I thought UUCP was
a precursor to ftp even; the name implies that it was for transferring
files, not mail specifically. Of course mail could be a file but doesn't
have to be...my question is basically what is wrong with completely
reproducing the internet on packet radio, using _all_ the same, most
current protocalls, and letting sleeping dogs like uucp lie? Obviously
I'm not an expert on the protocols and standards... :-)

And what do you mean by the "store and foward" thing? I do know for a
fact that my received mail on a Unix system is stored in a file, and sits
there waiting as long as necessary for me to read it. Presumably, at
in-between machines that are somewhere in the path of a particular mail
message's trip from source to destination, the mail message is written to
a file temporarily, and then the machine tries repeatedly to forward that
file to the next machine where it's supposed to go. When it gets some
kind of "ack" that means the mail has been forwarded successfully, then
and only then can it delete the message. That would be store and
forward, and i don't see any alternatives. UUCP must not be the only
protocol that implements such a method.

: For this to work we need three things:

: 1) Cooperation from the BBS software authors to implement the new
: functionality (specifically SMTP, NNTP, and RFC822 based mailers).
: This has been done many times over, and much of the code is available
: and can be re-used for this application. (Check out your local land-
: line BBS for an example.)

: 2) A distributed network routing database (ala the UUCP maps).

: 3) A user community willing to accept change (a new addressing format).

: I hereby step forward and volunteer to take on #2 above. Who else is
: willing to contribute to moving the BBS mail/news environment forward?

I am! What we have certainly sucks. As for old dogs not learning new
tricks, well, I suppose using packet at all must have been a quantum leap

for them at some point. If they learned that new trick why not this one?

Of course, I realize one of the primary barriers is that to make best use of TCP/IP and Internet-style mail forwarding, as a network user (as opposed to a sysop/provider) you'd need the right kind of client, be it JNOS or some hacked Internet tools, or better yet, Linux and completely unhacked Internet tools. But what about this: provide Unix shell accounts for the old dogs, so that they can just connect to their accounts as if they were connecting to a BBS, and then use the BBS's Internet tools like Elm or Pine or a newsreader to do their email. Then they don't have to modify anything at all on their own computers, all they have to do is learn how to use the tools at the remote site. Compared to the current helter-skelter, abominable user interfaces that every conventional AX.25 bbs I've ever seen has, this should seem easier to them, not harder. And when they're ready to upgrade their own machines it would be an easy switch at that point. I could provide this service easily enough, when at last I get some kind of BBS running, and it seems easier at first glance than throwing out the baby with the bathwater and designing something new and hokey. Then again, there may be reasons why Internet style protocols don't work as well on packet, I just don't see them yet. And as an object-oriented software designer I believe strongly in re-use! If there's no reason not to, why can't we just see packet as a replacement for the ethernet card, and abstract out the differences at the driver level, so that high-level software can pretend it's talking on the Internet?

Hi!

I just read the general HAM radio FAQ in 3 parts, where the last one
talked about a FAQ specific to this rec.radio.amateur.digital.misc group.
I don't find it anywhere :-(
(except the Guide_to_the_Personal_Radio_Newsgroups that I found under
the group's archive on rtfm.mit.edu -- nothing specific to digital radio
telecomms)

Please, someone give me an URL or mailing-list address to get it, or
whatever, I would like to get some general informations before I start
asking dummy questions :-)

As I am a real newcomer to the topic, it would be nice of you to indicate
me the most useful links that would explain basics of amateur radio
related to computers, how to make both work together, etc...
Basically, my dream would be to make up a connection similar to the
cellular/modem service by my own... Is that possible? Where to learn how
to do it? What other marvels can be done?

I saw a LOT of links to HAM stuff on Yahoo, but that's the problem, it's
too much, and I am unable to judge myself yet what is useful and what is
not in my case.

As I am studying in Electrical Engineering, I am not afraid of techno
talk ;-) Actually, as a Linux and HP48 user, I am kind of used to it :-)

Thank you for your help,
Thomas Pawlikaniec

I've recently got back on the air and linked my Icom 2/70 handheld up to a PK232 to experiment with packet.

The thing is my handheld is a bit OTT as a single freq, packet, transceiver.

What I'm looking for (I think) is a dedicated radio that can act as my packet radio, transmitting approx 10W. What should I be looking at?

Any suggestions for second hand mobile rigs or ex-PMR (although I've never done any conversion work and am a little apprehensive of this route) or possibly a specially designed packet rig (if such a thing exists - I vaguely remember a review in an old HRT of a KAM 2M packet?) welcomed.

73s and thanks

David Cripps G7IDB

I haven't seen any new additions (you have a source we can read?), but in the
past, you could use any unspecified code in the bands indicated. That usually
mean't that HF was restricted to specified codes. Can't use TADIL-A in the
HF Ham bands :-) But usually 70cm and above is unrestricted for the most part.

Typical Addresses for the serial ports are...

Port Address IRQ

1 3F8 4
2 2F8 3
3 3E8 4
4 2E8 3

There are a number of "aftermarket" boards that allow you to "customize" both the address and IRQ of a serial port. JDR microcircuits offers one that I am aware of that allows both of these options. I also saw recently a board by SIIG at CompUSA that supports non standard IRQ from 2 to 15 (could not tell if it supports non standard addresses).

Another option for a non standard is the board the Mouse Systems offers to change the IRQ of a serial mouse.

>reproducing the internet on packet radio, using _all_ the same, most
>current protocalls, and letting sleeping dogs like uucp lie? Obviously
>I'm not an expert on the protocols and standards... :-)

The UUCP protocols biggest ill, is its use of 64 byte packets. It was designed
for 300 baud modems. Which come to think of it, is basically what we have
on packet radio! (1200 baud, 9600, etc; they all are slow slow slow).

>And what do you mean by the "store and foward" thing?

UUCP uses bang used "bang" addresses before the Domain Name
System was invented. To get mail from your machine, you directed it
yourself. There bacame great hubs that everyone used as a base.
You would state your address based on this hub. For example, my
first uucp address was ihnp4!killer!disco!ssampson. That is, my
UniFLEX UUCP machine called disco, sent the mail to killer, and
killer stored it until forward time to the big hub called ihnp4. We do
the same thing today with the '%' bang. You can send your mail
to me via n5owk%n5owk%n0els@wb5cqu.ampr.org. What this does
is SMTP it to wb5cqu. He then stores it, and then forwards it up the
state to n0els, who stores it, then forwards it to my box. All SMTP via
TCP/IP, but manually directed. Much better than trying to SMTP direct.

>: For this to work we need three things:

>: 1) Cooperation from the BBS software authors to implement the new
>: functionality (specifically SMTP, NNTP, and RFC822 based mailers).

Just do one thing. Program in modules and processes. Don't make a big
program to end all programs. Choose a multi-tasker, and then build the
5 programs that must work together. These huge programs that have to
fit in 512k of memory are stupid. MSYS, JNOS, etc, are obsolete. They
are chains around our neck.

>the bandwidth is generally < 3 kHz. Is the restriction to 300 baud still
>upon us?

Let me see if I can clarify. This "new" rule is almost no change at all.
First, you have to define any HF digital transmission by its three components:

1) The data coding (the "code")
2) The protocol
3) The modulation scheme

The first of these, the code, defines how graphic symbols (characters) are
mapped into bits. The use of these is regulated by 97.305, 97.307 and 97.309.
For HF, the relevant rule is 97.307(f)(3). It requires that data be sent
using one of the codes: ASCII (with extensions for non-English), ITA2 (Baudot)
and the 7-bit AMTOR/SITOR code. What this means is that you *cannot* legally
send non-text data on HF. Sorry.

The protocol is simply the extra (noninformation) bits sent to control the
link. All HF digital transmissions use some form of protocol--even RTTY,
where the protocol requires the use of start- and stop-bits and defines
the order in which the data bits are sent. There has not for many years been
any rule that restricts the protocol being used. That's why we were able to
use AX.25, G-TOR, Pactor and Clover legally, even before this new rule, as
long as the data being transmitted was encoded using one of the legal codes.

The allowable modulation methods for HF digital are regulated in 97.3(c)(2)
and 97.3(c)(7).

The only thing that's new here is the bit about "documented publicly," and
that's a new *requirement*, not a loosening. (But almost any form of
publication--probably including posting on Usenet--will serve.)

For a copy of the ARRL Bulletin on this subject, see:
http://www.arrl.org/w1aw/1995-arlb094.html

Finally, while I don't know the details of MIL-STD-188-141A, I seriously
doubt it uses signalling speeds of 300 baud and above. >300 bits per
second, yes, but 300 baud, I think not. If it does, it won't work too
well on HF.

The only time I had trouble with the COM ports with Win95 was before I
eliminated the autoexec.bat and config.sys files from DOS. Win95 doesn't
need them so, unless you've already killed them, this could be your problem.
After I eliminated them, I had no trouble since.

Worth a try :) 73.

I still am a bit confused about what need to be publicly documented: If hypothetically, for example, I devise a new modem using say n-PSK, and in addition I use a revolutionary new and powerful encoding scheme that uses say several nested block and convolutional codes of course encoding only straight ASCII text. Would you agree that publishing only details about the waveform without telling the data encoding scheme is most probably sufficient for third party monitoring? How would anyone be able to "break" this unintentional encrypion of the original text ? Or would it be sufficient to say that you'll have to buy my $1000 black box to decode the publicly documented n-PSK signal.

What am I missing?

>For a copy of the ARRL Bulletin on this subject, see:

>well on HF.

Yes, that is a good point. The 300 baud regulation probably made good sense at some time in the past. We are, however, now at a junction in time that the separation between the analog and digital worlds are very fuzzy. When is "data" really data? i.e., should digital images or digitized voice be treated the same as "data". Just like the 300 baud regulation, we probably will see a number of such issues being questioned.

Subject: Re: Kamtronics KPC-3 software

MU>I bought a KPC-3 two years back, and since I had an Amiga, I didn't care
>what happened to the IBM software that came with it. Now that my Amiga

You simply must try KaGOLD from Interflex. A Test Drive version is
posted on ATTENTION to Details BBS at 909-681-6221. The absolute finest
software package available for the KPC-3 (as well as all other AEA and
Kantronics Single and Dual Port TNCs).

Look for KAGOLDTD.EXE or KADEMO.ZIP on ATD BBS. I have also received
permission from Kantronics to offer you their demo diskette, with
diagnostics software and product information files - its filename is
KANT-TNC.ZIP.

A few of KaGOLD's features...

Excerpt from "Performance Software" -- GOLD Software User Manual
Copyright (C)1993,94 by InterFlex Systems Design Corporation
All Rights Reserved

Quick Summary:

ALL For all users, GOLD (Pk, Ka, dsp, etc) adds the ability
for you to setup your station as a callbook server,
conference bridge, general file/information server, as
well as support for ANSI pics, restartable file
transfers, and more.

Version 9 represents a significant departure from the earlier
versions of GOLD software. Commands from remote stations are
now allowed, two screen modes are supported for every session- -
the normal text character screen and a new ANSI graphic screen
-- direct interface to callsign databases (SAM, Buckmaster, QRZ)
is supported, restartable file transfers, and improved operation
in Windows and other multi- tasking environments, and support
for CW announcements through ad-lib type sound cards.

o Callbook Support for four (4) CD based systems, and the
SAM disk-based callbook. Users can lookup callsign data,
the program does lookups automatically, and remote users
can request callsign data making the station a callbook
server (if remote commands are enabled and the
appropriate callbook cmd file exists). Callbooks
supported include Amsoft CD, Buckmaster CD, QRZ CD, SAM
CD, and SAM Disk based callbook.

o ANSI Graphics supported on all sessions simultaneously. Pics are saved automatically if desired, and the program can "flip" to graphics mode automatically. No other program offers simultaneous, multiple ANSI picture receiving.

o Restartable YAPP and GOLD transfers. YAPP-C is supported, and restartable transfers are done automatically, as the program determines if the remote station supports these features. Partially complete files have a text header that makes it easy to determine which files are only partially received.

o Conferences can be started remotely, allowing your station to be a conference server. Users can switch conferences, start new conferences, and leave the conference and remain connected if desired. They can also send messages directly to other stations in the same or different conference.

o Remote commands, including user defined commands in CMD files. This allows you to create a file server, ANSI pic server, radio mods server and more. The ability to create commands that remote users can issue opens a whole new set of outlets for for your programming creativity.

o Morse messages can be directed to an Ad-Lib compatible sound card. Also, CW pitch can be set by the user, both user options are in the SETUP area.

o Network View lines now show headers in low-video, and text in high-video, making it easier to distinguish headers from text. This is done automatically.

Here's my APPLICATION that MUST be completed before anyone can access
my TNC Access Door:

ATTENTION to Details BBS
5085 Trail Canyon Drive
Mira Loma, CA 91752-1685

Voice - 909-681-6210 BBS - 909-681-6210

TNC Packet Access Agreement

This following Rules and Regulations must be agreed to before access to
the TNC Door will be granted. You will be required to send a copy of this
Agreement - as well as a copy of your Ham License - to ATD BBS. This may
outwardly seem unreasonable, but there are legal ramifications involved,
and I'd rather not have to respond to any FCC complaints that have my
name on them <grin>. Here we go:

1. You agree to follow all Part 97 regulations.

2. You agree to relinquish the TNC whenever requested by the Sysop.

3. You agree to report any and all abnormalities while using the TNC -
a Message to the SYSOP will suffice.

4. You agree NOT to change your Callsign - using the TNC commands -
while using the TNC Door.

5. You agree to adhere to any rule changes made in the future concerning
the operation of the TNC Door on ATD BBS. I promise to announce any
changes that affect operation of the TNC Door as soon as possible,
via either the [N]ewsletter or via private EMail to you.

If you agree to the above, then print out this entire textfile, sign below,
and and return with a copy of your Amateur Radio License. You will then be
granted Amateur Radio Operator (HAM) access.

Hi everybody,

For some time now I'm trying to get my Alinco DJ-560 working with my PK232MBX.
It seems I can't get audio transmitted. RXing packet is OK and I can
transmit BUT no audio.

Anyone out there has a solution how to make the connection??

Thanks for answering.

Bye, from mauricea@glo.be (Maurice Andries)

Hi everybody,

To all who answered to my message about the PIcard... Thank you... I send
personal replies to everybody but got a few 'bounced' mails...so I thought
to send it via this list.

Bye, from mauricea@glo.be (Maurice Andries)

>forward, and i don't see any alternatives. UUCP must not be the only
>protocol that implements such a method.

That's the rub. TCP/IP transfer protocols like ftp depend on realtime
end to end connectivity. They forward packet by packet, not file by
file. There is no file storage at intermediate sites. The file by file
activity is handled by the originating and terminating systems *only*,
and in realtime, by the TCP layer, over perhaps hundreds of intermediate
realtime IP hops (though in practice the TTL field usually limits total
hops to around 16 so that if you and your destination are more than a
total of 16 hops off the internet backbone you won't have connectivity).

UUCP forwards file by file. It doesn't require full time/realtime end to
end connectivity to operate. Each hop does file by file transfers in
a standalone fashion between only that pair of machines. Thus there is
no limit to the number of hops that the file can ultimately traverse,
one hop at a time.

Since we don't have realtime connectivity in any practical sense
over more than a very few hops in amateur packet, TCP/IP transfers
are limited to that radius. With actual file by file store and forward,
we can inchworm our messages from system to system where each transfer
only has to traverse a few hops, which works on amateur packet. This
models closely with the dialup UUCP style of forwarding. So that's
what the current BBS network implements.

Now there's a kludge, called UUCP over TCP/IP, used by some in the
usenet distribution. What this does is take UUCP batches and use
intermittant dialup TCP/IP connections to inchworm the distribution
from site to site. There are some limited advantages to this hybrid
over just using UUCP dialup sessions. The primary advantage is that
the dialup can be handling other TCP/IP traffic at the same time
as the UUCP forwarding is taking place since TCP/IP packet by packet
forwarding is inherently multi-session. That's useful if you have
excess link capacity, but is usually a moot point at the low baud
typically used in amateur packet.

TAPR sells (or at least used to sell) a bare board for the classic TAPR TNC. They also have the ROMS for several versions of software to run it. All you gotta do is scare up the rest of the parts and put it together. You'd probably be better off buying a used MFJ 1270/KPC-2 or 3/PK-88, tho.

I found exactly the same problem. The VCO radiation is so strong
that it affected the operation of the PLL. It created reference spurs
on either side of the VCO out past 200kHz. I was able to fabricate
a shield over the VCO, including the PC inductor, that reduced the
spurs to an acceptable level.

The receiver has very little front end selectivity, and I was plagued
with pager intermod. I was able to replace the front end "tuned"
circuit with a Toko two-section helical filter. Now I don't have
the intermod problem, and the sensitivity seems about the same
(not measured but using off the air signals).

I think that the only thing you have to do is to convert the logic
levels of your serial port (because C64 works with TTL levels, unlike
the RS232 modems). I suggest you to use the MC1488 and MC1489 IC's.

I just purchased a Kenwood TM-451a. It advertises "9600 ready" right out of the box. I have since found out that the T/R switching is a little slow. (typical of PLL radios) My question is this...if I can get everybody on the 9600 freq to set a high TXDELAY, wouldnt this remedy the slow T/R switching problem? I know it would slow down everybody a little, but a least it would work....right?

Source record: 40920

After an absence of about 18 months from the AX.25 PBBS scene,
I recently started using a local PBBS again.

Nothing's really changed, on the surface at least. Still the same
jumble of bulletins addressed to anybody/anything (ALL, DEBATE,
DCC, FOOTY, SAT, HELP etc etc etc ..... many dozens of them), all
mixed up together in one big pot. If you think you might be interested
in a particular topic, but don't know exactly who/what any relevant
bulletins are addressed to, you have to list all of them -- a
tortuous process in the 1200 bps world that still exists over here.

Why are people still wasting so much valuable effort and time in
"improving" bulletin handling in the AX.25 PBBS, when the work has
already been done and is freely available in the TCP/IP world (I'm
thinking particularly of UseNet "News")?

I'm curious to know if anyone is looking into replacing the AX.25
PBBS bulletin system with, say, a "News"-like client which will make
it much easier/quicker for users to access bulletins of interest.
Perhaps presenting something like the KA9Q mailbox "Area" interface
to the user?

KaGold is Ok I use it but it is over priced. There are
a number of other less expensive solutions for users that
don't want or need every feature known to man. The advantage/
disadvantage of KaGold is that it uses host mode of your TNC.
If you want all of the whistles and bells this is the best way
to go but for most users it is a waste. If you want to connect
to your local bbs and read a few posts there are a lot of
programs that will do that quite well. I have also uses Paket 6.1
it is much more intuitive than Gold and for a simple TNC like the
KPC-3 is more than enough for most users. These are just my opinions
and worth exactly what you paid for them.

>
>The problem is issuing the changeover characters at the
>right moments (when bufers are empty...)
>

This is not too hard to accomplish if you run the TNCs
in their Host Modes.

With the AEA you will need to set converse to TRANSPARENT mode. By
running in this way the CHANGEOVER character will transmit as normal
data. To monitor the buffer of the TNC use the ZFREE command. This
will return the number of blocks that are available in the TNC. Using the
ZSTATUS command you can determine when the buffer is empty. To switch
the link over in Transparent mode you will need to use one of two methods.

The first is available for AEA TNCs with firmware versions with at least
12-1-93 dates. In these versions you can use the OVER command (host "OV")
this will cause the link to switch immediately, regardless if there
is data in the buffer or not.

For the 3-5-93 versions of AEA firmware, you will need to switch from
transparent mode back to converse and issue the CHANGEOVER character (normally
CTRL-Z). This is not too clean but it will work.

Another point you might consider is that the OP response for the AEA
will return the current link status. ie "IDLE". If you find the
link is in IDLE you also can determine that the data has been sent.

For Kantronics it is a little simpler. When running in HOST mode you
can POLL the TNC using the STATUS command, this will return current
stream/channel connections as well as the available memory for both
ports. If you "save" the memory available before starting a transfer
you can use this as a compare to determine when the buffer is empty. A
simply

```
if ((save_memory - current_memory) == 0)
ChangeOverLink();
```

(in 'C')

should do the trick.

Hope this gives you some ideas. The advise is free.

I can't help with the TOR changeover problem, but have you
considered Clover? It transparently makes the channel look
like a duplex link, IE there's no requirement for a link
turnaround signal. And it performs better than the TORs
too. HAL has a programmer's API so you can write a driver
to work with your higher level application.

Packet length and window size are negotiable at link establishment
time for G protocol (the most commonly used). The fact that many
implementations are tuned for a low speed & error prone link is a
historical fact; but it isn't a requirement.

I don't have my copy of Chesson handy, but I vaguely remember that 512
byte packets were ok, and you could certainly have a 7 packet window.
That's enough to hide the turnaround and latency of even V34 modems.

regards,
Ross

While the documentation requirements haven't been made explicit, I'd venture
to say that you need to document whatever is needed to allow one to extract
the original coded data. So both the protocol *and* the modulation scheme
should be documented. Granted, "extracting the coded data" may present
practical difficulties in many useful systems, but as long as what keeps
a listener from doing so *isn't* unavilability of information about the
system, I think you're covered. To me, any attempt to keep the modulation
and/or protocol secret smacks of intent to hide the data. Of course, only
the FCC's interpetation counts, and note that their language is quite broad.

I don't think the ASP is user-programmable. Proper DSPs on sound cards
like the Cardinal can be used for CW filters, modems, etc.

The last time I checked, TAPR was almost out of the boards and almost certainly is by now. Unless one had a well-stocked junk box, getting the parts would be quite difficult and most probably cost more than one of the mentioned TNCs. The most popular use for these boards, I understand, was to build them up without the modem as a front end for a TAPR or G3RUH 9600 bps modem. TAPR is working on a a similar board without modem (TNC-95) for use with its DSP-93 (and presumably with other external modems), but that project has not been completed.

Good. I would think 512 byte packets would work well for fairly clean
packet links. A dynamically adjustable packet size would be even better.

I'm curious how the VCO radiation is affecting the operation of the
PLL. Certainly the reference spurs are expected as a result of leakthrough
in the loop filter; are the spurs much higher than you expect? Did you
check the loop filter to make sure it was working correctly?

> The receiver has very little front end selectivity, and I was plagued

Yeah, there's apparently way too much gain in the front end
with way too little selectivity. I'm surprised it works as
well as it does.

I am also using 1.00A and it works fine for me. At the risk of being
deemed a "Luddite", I did not care for the second version very much.
Also, since I do not have the PK-232 MBX model, I could not use the
Pakratt for Windows version and can't comment on it.

Gary Coffman (gary@ke4zv.atl.ga.us) wrote:
: That's the rub. TCP/IP transfer protocols like ftp depend on realtime
: end to end connectivity. They forward packet by packet, not file by
: file. There is no file storage at intermediate sites. The file by file
: activity is handled by the originating and terminating systems *only*,
: and in realtime, by the TCP layer, over perhaps hundreds of intermediate
: realtime IP hops (though in practice the TTL field usually limits total

Sorry, what's a TTL field?

: hops to around 16 so that if you and your destination are more than a
: total of 16 hops off the internet backbone you won't have connectivity).

So you believe they've completely ruled out store-and-forward methodology
in the current crop of standards such as ftp and SMTP? That would be a
shame.

: Now there's a kludge, called UUCP over TCP/IP, used by some in the
: usenet distribution. What this does is take UUCP batches and use
: intermittant dialup TCP/IP connections to inchworm the distribution
: from site to site. There are some limited advantages to this hybrid
: over just using UUCP dialup sessions. The primary advantage is that
: the dialup can be handling other TCP/IP traffic at the same time
: as the UUCP forwarding is taking place since TCP/IP packet by packet
: forwarding is inherently multi-session. That's useful if you have
: excess link capacity, but is usually a moot point at the low baud
: typically used in amateur packet.

But that's only right now; I imagine we will have higher speed before
long. Whatever methods we pick should work well for both low and high
speeds. And store-and-forward shouldn't have to preclude multi-session
transfers. If each packet contained a sort of UUCP session ID then you
could have several UUCP sessions going at once. All that
store-and-forward should mean is that the distance an ACK has to travel
per packet is reduced, because the file transfer is a shorter distance.
Between store-and-forward nodes something like FTP could still be used.
As the ham network gets faster, you simply increase the number of hops
between nodes, and the limit of that as speed -> oo is what we already
have on the internet, ie someday we can get from source to destination
without any intermediate store-and-forward. I guess this is pretty much
what this kludge you're talking about is, but we could use ftp rather
than UUCP, the only difference is that it's short-haul ftp, and the short
hauls add up to inchworm the file end-to-end.

Where can you get a DDS capable of those high frequencies? The trouble
is that a DDS needs a clock running at least the Nyquist rate to generate
decent waves. So you'd be talking about a clock, a ROM, an address
sequencer, and a DAC that could all run at several hundred megahertz!

His requirements are to tune from 108 to 130 MHz, or over 22 MHz. I know of several DDS capable of such a range. You then heterodyne the output with a fixed oscillator for your final frequencies.
Example: your DDS is good from 2 MHz to 25 MHz. Just mix it with a crystal oscillator signal at 105 MHz, and the output range will be (with proper filtering) 107 to 130 MHz. Naturally, you'd want to do it differently, to be able to remove that 105 MHz tone from the 108 MHz signal might be tricky, but you get the idea...

4659. HAL P38 Clover Card

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-10-20 00:00:00 UTC
From: willi_r@mail.uwlax.edu
Message-ID: <4674fu$a3t@alfred.acs.uwlax.edu>
Source record: 40846

1. Anyone using the P38 card from HAL? If so, is anyone having any problems with data transfer in the Pactor mode? I can link just fine with other Pactor stations but have difficulty in phasing or otherwise properly connecting and either I see each burst as an error or the other station sees errors and keeps sending RQ's back. If I discontinue the link and try again it often works OK for a while. Then after several minutes the same thing can happen and messes up the QSO. Appreciate hearing any comments.

2. I know there are a number of recommended freqs for Clover operation such as 14065.5, 10136.5, and 7065.5, but the ones I have heard for 80 meters don't seem like the best place to operate. Any thoughts on Clover calling freqs on 80 meters?

Attached you will find modifications for both model Tekk radio's that improve the receive and transmit performance at 9600bps. It's reported that both TEKK and PacComm have been making some/all of these modifications. I have no idea when they implemented these changes. Receiver IF tuning is important with both receivers.

John, WB3ESS
j.k.bednar@att.com

Tekk Data Radio Mods for 9600 bps
by John Bednar, WB3ESS
Original Issue:12/93
Last update: 5/16/94

TEKK KS-900L Receiver Mods (black case)
At the 9-pin interface connector add a 2.7k ohm resistor in series with the wire going to pin 5. Next, solder a 0.001uf capacitor between pin 2 and pin 5 of the same connector.

TEKK KS-900L Transmitter Mods (black case)
Solder a 3.3uf tantalum capacitor (observe the polarity) in parallel with capacitor C31. The transmit requirements are not changed so re-adjusting the transmit level will not be required.

TEKK KS-960L Receiver Mods (chrome case)
Remove chip capacitor C18 and replace it with a 0.001uf leaded capacitor or chip capacitor.

TEKK KS-960L Transmitter Mods (chrome case)
Bypass the transmit limiter, modify the modulator, and inject the audio into TP9 with the following steps:
1) Remove the wire attached to pin 4 of the 9-pin connector and solder it to ground.
2) Solder the (+) lead of a 10uf tantalum capacitor with 0.2" leads to the 9-pin connector - pin 4.
3) Prepare a 1.8" piece of wire with 0.2" ends and solder one end of the wire to the (-) lead of the capacitor added in step 2. Tuck the other end of the wire around the circuit board in the corner. Don't use the corner where the BNC is mounted.
4) Locate the junction of C43, C92, and R41. Form the wire, trim the end to 0.1" and solder it carefully to this junction.

5) Locate the junction of R43 and C47. Carefully remove the solder from that solder pad. With a sharp knife cut the trace diagonally between R43 and C47. Check your cut with an ohm meter to insure that the trace is open. If you break R43, C47, C48 or C49 don't worry because these parts are no longer used.
6) Locate potentiometer VR1 and turn it fully CW.
7) Re-adjust the transmit frequency and the transmit deviation.

A complete article with frequency response graphs will appear in the January 94 Northeast Digital Association Quarterly. As of 10/95 this issue has not been printed.

I can't say WHAT the PK-96 has in it, but I do know that the K9NG was reworked a year or two back, and vastly improved over the original. Compatibility problems are not the huge problem they were. Not sure what the changes were (Can anyone tell me?), but have heard praise.

4662. HostMaster II+ question

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-10-20 00:00:00 UTC
From: mjoyce@smiley.mitre.org
Message-ID: <46872g$4po@linus.mitre.org>
Source record: 40849

I need some help.

The problem involves the "Print This Channel" feature (function key 6) provided by Kantronics' HostMaster II+ (ver 3.11). When this feature is selected, the characters printed on the printer are echoed and a carriage-return, line-feed is not added to the end of each line. For example, instead of "HAD" the pattern "HHAADD" is printed. I'll leave the carriage-return, line-feed problem to your imagination.

As a stop-gap, using the "Save to File" feature (function key 5) and selecting PRN works just fine. This scheme directs the data to the printer, does not echo characters, and places a carriage-return, line-feed on the end of each line. While it this circumvention works, it is more cumbersome. But more important, why doesn't the "Print This Channel" feature work properly?

The printer is an Epson LQ-570. Host is running DOS5.0/Windows3.1.

mike

4663. Re: Merging BBSs and the Internet (was MSYS ...)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-10-20 00:00:00 UTC
From: brian@nothing.ucsd.edu
Message-ID: <468ktp$76e@news2.ucsd.edu>
Source record: 40850

Gary is slightly incorrect here; the TTL is typically set to 64 in almost all IP implementations these days, and 255 is becoming more common as the internet gets deeper and thicker.

Keep in mind that the TTL is NOT decremented when tunnelling encapsulation is forwarded from router to router, so even the torturous paths that packets take to get to some parts of the AMPRNet aren't really that many hops away.

The internet is the world's second largest network (the public telephone system is the largest). We hams could steal some really good ideas from it, if only more people were willing to adopt them.

4666. Anybody used Ramsey FX-440 for 9600?.Humm...

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-10-21 00:00:00 UTC
From: "J. Silva" <jsilva@zeus.ci.ua.pt>
Message-ID: <46aksk$5fu@titan.ci.ua.pt>
Source record: 40853
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.homebrew

>>Does the Ramsey FX-440 transceiver kit actually work for 9600 baud packet?
>>I have friend-of-a-friend word that Ramsey claims it works on 9600 baud
>>packet, but nobody has actually been able to get it going quite right.

Some time ago I bought their kit. I found that the receiver suffered
from
many spurious responses which, given right (wrong?) packet frequency
would
make it pretty useless. I did get it to receive 9600 but had a pretty
strong signal to work with and didn't make any performance measurements
so
I can't really comment on the receive performance. The transmitter was
a
disaster! Because they have no shielding anywhere in the radio the
transmitter output got back into the PLL and the resultant signal
resembled
broadband noise. I wasted a lot of time trying to clean that up and
never
was successful. I believe that taking the time to build a good shield
around the PLL would have solved the problem but there are problems with
the board layout that make it a difficult thing to do. I did find a
few
minor design errors which resulted a very long (for 9600 packet) TR
turnaround time. They directly modulate the VCO, like most radios, so
the
transmitter will distort the signal. I never got far enough to worry
about
that.

A friend of mine bought one and had similar problems. Both of us wasted
a
good bit of money. Since then we have discovered the joys of converting
commercial (e.g., Motorola and GE) radios...they work!

My recommendation is to avoid the unit unless they have made major
design
changes since the original radio (the 2-m version failed the transmitter
spurious output test -- see the QST review from about a year ago).

Source record: 40855

Hello, The Michigan Technological University Radio Club is looking for some info on how to do a hardware reset on a RC-1000 repeater controller. Our problem is that our processer is not recognizing any of the "D" commands. The system is reading back all the dtmf digits using the readback function which tells me that the decoder is functioning properly. It will also accept the D7b and d7c programming codes properly but not any others. Perhaps this could be because the code that our manual says is supposed to come up D62 for the program code is not right?! If anyone has any answers I'd pay to hear them, otherwise I'll be forced to trash this controller. I've tried calling M.C.C. and they are out of business.
Thank You,
Rob Hall AA8LA

Hello, my name is Mike and I am in search of a Motorola
Saber 3 radio. As much as I would love to have a "secure" Saber
my HAM lic can live with only a "clear" version. 440-470 stock
pkg is fine.
Sounds easy enough, save for this one small caviot, it
must, must, have it's Serial Number tag visible and in good
condition on the back of the radio. Here in Brooklyn North the
police often "detain you for varification of ownership" of
your radio if the SN# tag is not in place. I have a wonderfull
Saber 3 that I bought at a HAM fest but it lacks the desired SN#.
So if for some reason money sounds better to you then
owning a Saber 3 clear uhf 5 watt radio then e-mail me fast

OK guys, I've decided to take the plunge. An avid HF'er for years, I gotta take the plunge and find out why so many are intrigued w/ packet. I have a RS HTX-202 and 404 and am ready to hook up to a TNC(?). I've read a few articles and books, but the subject still appears confusing.

.as I understand it, the 1200 baud stuff is prevalent and availably cheap (PK-88, KPC-3, etc), also referred to TNC-2.

I'd like not to spend over $100, but would also not like to throw anything away should I get hooked and want to go 9600-19.2 (the 1200/2400 speeds are not particularly exciting at first glance). I recall reading from a VE-ham that the KPC-3 is not expandable to faster speeds, for example. Please help out a confused, naiive, but fellow ham. Models, good stores, deals, kit, etc advice/offers are appreciated. Get me into the 20/21th century!

> in a MSDOS based BBS ?

There is a product called "Amateur Radio Packet Door (ARPD)".
I don't know if it is anywhere on the Internet, but you
might find it on some shareware CD-ROM.

> Or a simple Packet BBS that can run stand alone ??

There are many of them. Best is FBB, though MSYS is also
extensively used as it supports TCP/IP as well. None of
them is too simple to set up though.

When things get weird at work several of us look at each other and cross our eyes and say in unison, "Fix it but don't change anything." Once Upon A Time we thought this was a bit funny, but it has become a way of life. "Compatibility" is the god of technology management these days. The above looks like a case of "Fix it but don't change anything."

I agree compaptibility is useful but it should not be used as an excuse to limit progress. A very good case could be made for totally incompatible command sets for no other reason than to hammer home to the user's brain that one is using something different. Our local PBBS sysop once logged into my (then) Linux system running WAMPES (logins went to a bash shell). Saw the message "you have mail" and he tried and tried and tried to read the mail with "rm". That's all he tried. He gave up in disgust and proclaimed that it would be impossible to retrain all the hams who have fought hard to learn "rm" for Read Mail.

Would really like to get things to the point a user would use exactly the same software on packet radio as for wired internet. This way the command set issue is one for the user to determine. Let him choose his favorite news reader, mailer, and telnet programs. Has anyone played with SL/IP or PPP over a transparent TNC link?

The most important thing you can do is *not* to ask here, but first ask
your local packet community what and were they operate. It may be fun to
jump fresh into packet with a 9600 TNC but no fun at all if you have the
only 9600 TNC.

Don't even think about 9600 on your HT's.

4678. Contesting software for KamPlus?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-10-22 00:00:00 UTC
From: jdy18@aol.com
Message-ID: <46edq1$2ik@newsbf02.news.aol.com>
Source record: 40865

I've been looking for some contesting software for the KamPlus. I'm using HostMaster II+ for general operations, and it's OK. However, while it has a rather clumsy logging function, it won't dupe. That's not very good for RTTY contests. KaGold can be made to dupe (by bringing up previous contacts in the banner), but I don't like the fact that it won't display the PacketCluster and HF contact at the same time. You have to switch back and forth - that's no good. I understand that there is one or more programs available specifically for RTTY contesting. I think perhaps WF1B produces such a program. Any comments would be appreciated, including sources for what I am looking for. Program must display HF and VHF on the same screeen. It must include serial numbering and logging for contacts and must dupe.

KD2L

4679. WHY NOT USE REGULAR COMPUTER MODEM ON PACKET?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-10-22 00:00:00 UTC
From: flanders@znet.GroupZ.net
Message-ID: <flanders.24.0199B7DE@znet.GroupZ.net>
Source record: 40866

I think I remember reading many years ago that the guys that started packet did so by using some surplus obsolete (telephone) modems. They started with these just because they were dirt cheap, and our ham radio standard for packet modems was thus fixed as something that had to be compatible with that old standard.

Are there technical reasons why nobody has tried to use today's conventional telephone modems (like the one that will send this posting) at 1200 baud to do conventional packet? I mean reasons other than low-level protocol compatibility - I presume the two protocols are different, so I am not asking if the modern computer modem could communicate with a packet modem.

Couldn't two "modern" modems, both using the same protocol, communicate between themselves, using their own version of "packet" on VHF? Is there any HARDWARE problem here?

4680. Help! with mfj1278 settings and TS-940s kenwood

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-10-22 00:00:00 UTC
From: genz0003@gold.tc.umn.edu
Message-ID: <genz0003-221095165033@dialup-3-228.gw.umn.edu>
Source record: 40867

Hi, I'm trying to get my 1278 mfj data controller working with my Kenwood ts-940s. If you have sucessfully gotten yours to work, please let me know what setting values you have used(i.e txdelay, ack, etc...) also does anybody use the mic processor during transmission? Does anybody have the pin wiring for the 13 pin accessory plug in the back of the ts-940s? my manual has the fm/fsk part ripped out of it. Any help would be most appreciated ! thanks!, steve, wi0e

>Alan
>roseag@mosler.ham.muohio.edu

Better you buy another interface instead of 1278
It'is really poor because all soft I tried has a very low resolution
To receive and trasmit fax in "professional mode" try the soft JVFAX
7.0 with a stupid UA741 based interface, and for trasmission direct
from the speaker of the PC. Support every VGA vesa extension and
receive and trasmit also color faxes and sstv.
I swear!! Great...
Cost of hardware... 5000 italian liras (less than 4 US bucks)
In packet and rtty Mfj1278 is still really good....

4683. Q: Using dual-port TNC in KISS mode?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-10-23 00:00:00 UTC
From: jdc3538@osfmail.isc.rit.edu
Message-ID: <46em2r$9b0@news.isc.rit.edu>
Source record: 40870

I have a Kantronics KPC-9612 dual-port modem. I'd like to use it with TNOS which requires KISS mode. Is there any way to use both ports in KISS mode?

Also, the manual mentions 'XKISS', the extended KISS protocol as defined by G8BPQ. What's that?

From: sunit@netcom.com
Message-ID: <sunitDGvyzu.C3p@netcom.com>
Source record: 40871

Gentle People:

I'm looking for a remote control keyboard so that I can sit with the keyboard on my lap and have it communicate with my PC. I have tried long wires and it's still too unwieldy. Is there some vendor that sells either a remote keyboard or can I buy some components and put one together (and what components would those be)?

Alternatively, I'm also interested in having a TV-like remote control communicate with a PC for simple browsing applications. Is there some way I can get my PC to either understand the up, down, etc. keys on my TV remote, or some other remote?

My apologies if this is the wrong group to ask for such information; pointers to an appropriate group will be appreciated.

I do not frequent USENET so e-mail replies will be greatly appreciated. If there is sufficient interest, I shall post a summary of the replies I get.

Thank you.

Sunit.

4685. ARCNET cards with NOS

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-10-23 00:00:00 UTC
From: jpheulin@ix.netcom.com
Message-ID: <46g9ke$6hj@ixnews2.ix.netcom.com>
Source record: 40872

Well, I picked up a couple of ARCNET AL-3351 at the swap meet.

I have been using NOS in a cheap 286 box here and talking to it from my desktop PC thru a comport slip link. I would like to use these ARCNET cards so I can setup some commercial TCP/IP software here (Don't cringe

..maybe WIN95!!!).

The question is: Do the various flavors of NOS support this ARCNET card

and how..I am using WNOS4 here and can recompile it with the 'ARCnet thru PACKET driver' defined but what next ???.

As you can see, I am fairly new at this.

At the moment I am running WNOS in the 286 box and WNOS4 in the PC to talk to it which sort of defeat the purpose of having a cheap PC out there, you will have to agree..

Hope you can help, 73 and bye

Please reply here or direct at:

>roseag@mosler.ham.muohio.edu
>
I have a MFJ1278. Mine only supports black and white fax. Plus the
?4.?MHz clock drifts like a cheap watch. I gave up on the MFJ and use
JVFAX (V6.0). With a real(and I mean dirt cheap) converter you can
recieve very good true greyscale HF wx and press(kind of rare) FAX.
You can snag a copy of JVFAX from the oakland ftp ssimtel mirror.
If you bought your MFJ new, MFJ included some sort of FAX program.
If you want, I will take a look at my orignal MFJ disk and see what
they sent.(I was not real impressed and wrote my own special terminal
package for RTTY/ASCII(Yea real common) and Amtor.
The MFJ 1278 is a great RTTY/ASCII/Amtor ok CW and verrryy bad FAX and
SSTV decoder. JVFAX just stomps it into the mud.
VHF packet is good, but HF packet has some trouble in the crowded ham
subbands.

What are the "best" (clearest, most complete, readable) books on packet radio?

What opinions have you to offer on the "BayPac" module ($49.95) which plugs into personal computers, avoiding the need for a TNC? Other than its limit of 1200 baud, what are its PRACTICAL disadvantages, for packet work?

Any help you can offer will be appreciated ... thanks in advance.

:
: Why are people still wasting so much valuable effort and time in
: "improving" bulletin handling in the AX.25 PBBS, when the work has
: already been done and is freely available in the TCP/IP world (I'm
: thinking particularly of UseNet "News")?

Good question... Hams just don't want to change. Why do people
still accept the idea that on the Internet your personal mail is
delivered virtually immediately, while on packet it's ok to sit on
a BBS until it's 'forwarding time', and then it *might* send it. Personal
mail should always be delivered *right now* and not wait at all. Heck,
mail might actually make it to it's destination at a resonable amount of
time for a change rather than having the ALL* bulletins make it around
the world faster.

There are a few folks running NNTP servers on packet and trying to
distribute bulletins that way, but from what I've seen there might be
a few NOS systems polling it and then reforwarding the messages back
to the regular AX.25 BBS's again. At one time I used to just read the
messages right off the NNTP server itself using tin over packet, and
that really amazed people that it was even possible to do that, but it
didn't catch on since everyone thought NOS was *cool* with all the
areas. What is needed is some kind of newsreader that a newcomer to
packet can use, similar to the way the BBS's can be used. As far as I
know that doesn't exist yet without having to run something like Linux,
but with that you usually need to run TCP/IP and preferably character
mode to really be worth it.

Speaking of Linux on packet, you would think that with the development of
AX.25 in the kernel that people would want to run *real* applications
over the air. What I've been seeing more and more of is people wanting an
AX.25 BBS with FBB forwarding in it. What a waste. They should be

encouraged to run an NNTP server instead and get their users who run Linux to just run tin or some other newsreader.

4700. Help! Need Systech MTI-1600 board or docs

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-10-24 00:00:00 UTC
From: garym@crash.cts.com
Message-ID: <garym.814509662@crash.cts.com>
Source record: 40882
Cross-posted to: comp.sys.sun.wanted,comp.sys.sun.admin,comp.sys.sun.hardware,rec.radio.amateur.digital.misc

I am a volunteer with a group that provides emergency and disaster communications services. We have a BBS (it's really much more than just a BBS) running on a donated Sun-3 and the MTI-1600 serial card we have been using seems to have bit the dust. If we had the documentation we might be able to diagnose and fix it; or maybe someone has another MTI-1600 they aren't using?

If you have an MTI-1600 or equivalent (or even a terminal server :-) or just documentation for the Systech MTI-1600 that you would be willing to donate (I'll pay any shipping or photocopying costs). We have a Sun-3/160, which is a VME bus but we have a Multibus adaptor card we have been using with our MTI-1600 (which failed).

Or if you know how to use the diagnostic mode on the card, even that might be helpful. While the machine is up and running, we have lost all our connections which come thru this card, we have phone modems, radio modems, and emergency information via satellite that is fed in thru this card and we're stuck without this card working. We were using 10 of the 16 RS-232 ports on the card. Any help would be appreciated.

For more information about our organization, and what we do, and about our computer system, see <http://www.cts.com/browse/garym/races>. Donations are tax deductible under 501(c)3.

Thanks,

You still use packet BBS's? I gave up on them a long time ago. The only mail I send/receive over packet is via SMTP, and it doesn't matter then if it's another packet radio TCP/IP host or one on the Internet.

: Invariably the several times i've sent email to locals via packet I've
: asked them about it on voice weeks later and then they turn on their

In at least in Southeast Michigan the packet BBS's are very very much poorer than they were about 5 or 6 years ago. Back then we were trying to figure out how to increase the speed of packet messages to their destination. A few hours anywhere in the state and under 24 hours to anywhere in the country was way too long. Right now it's very very common to take a day or two for a message to travel about 75-100 miles within the SE Michigan area. I still get people sending me message headers now and then for personal mail that took a day or two just to go through 2 or 3 BBS's, while a bulletin will get through right away. This is the reason why a large portion of the 'old timers' on packet in my area don't use BBS's anymore, we see them as a failure in packet radio. Most have gone to TCP/IP on packet and/or the Internet.

: I am curious to know how often you check your packet bbs for messages? Do

I have an agreement with a local BBS operator to auto-forward any mail for me to my TNC. He also forwards any messages for my wife (also an Amateur Operator), and any ARES related messages for Colorado or my ARES District. Of course, I leave the TNC on 24 hours a day, backed up by a battery. This way, I have the blinking LED if the mail is for me. I do have to log into my mailbox to check for ARES related messages, or any for my wife. I also keep a TNC logged into our local ARES packet cluster (24 hours a day). I use an HP unix computer system, and keep two windows open with a comm program, so it's fairly easy to check whenever I want.

By the way, anyone know of a good terminal program for unix? Right now I'm using a unix 'look-alike' of ProComm (pcomm) and, while it's not bad, it does have some strange quirks.

Hi Ken!

This is the best URL for the most recent MSYS versions:

ftp://coffman.csuohio.edu/

You'll find version 1.19 as an ".exe" self-extracting archive on there...

No, neither of those is a TNC-2, or clone of a TNC-2. The TNC-2 was
originally a TAPR design, and several companies make licensed clones,
but neither the AEA nor Kantronics designs are TNC-2 clones. The
MFJ-1270 and the PacComm Tiny 2 are TNC-2 clones. The advantage of
buying a clone is that third party hardware, like a 9600 baud modem,
or third party firmware, like TheNet, will work. They won't work in
a KPC-3 or PK-88.

>20/21th century!

Right, you either want one of the TNC-2 true clones, or something that
operates with the TAPR disconnect header (PK-232), or something from
Kantronics that *already* includes any modes you might want to use
later, such as the KPC-9612. However, be aware that your RS handhelds
will only operate properly at 1200 baud. They aren't designed to pass
9600 baud, in fact few voice radios are. For that you'll want a Tekk
data radio or a Kantronics D4-10, or (big bucks) the Azden PCS9600D.

For now, I'd suggest the Tiny 2 or a MFJ1270/1274. They'll work with
your radios at 1200 baud, and you can upgrade them to 9600 later
when you get a radio that can handle it. Or just buy a KPC-3 and
figure on replacing it too when you move up in speed. All of those
choices are going to be over your $100 budget, but only by $20 to
$30. You can probably find any of them used in the $60-$80 range.

JIm's advice is good. If you expect packet to be like the internet,
forget it at 1200 or 9600 baud. It's much too slow, and internet
style features and support generally aren't there. However, if you're
interested as more than a user, IE you're interested in the technical
aspects of data communications (hardware or software), then it can
be educational. But if you want internet style performance, you can
have it with more advanced systems (such as the WA4DSY 56kb RF modem
and TCP/IP software). *Then* you're talking ISDN level performance
and internet style services.

From an application perspective, I'd totally discount the BBS
world. It's a pale shadow of what we have here. However, there
are two *killer apps* that are useful at the low speeds. One
is Packetcluster. If you're a HF DXer, you can't afford to ignore
Packetcluster for DX spotting reports. The other killer app is
APRS. This is the geographical mapping and tracking program
that allows you to plot station positions automatically on a
map, either from GPS data or from hand entered position reports.
For certain public service activities, for RDF, and for navigation
experiments, this is a must have.

MIME (Multipurpose Internet Mail Extensions) Part One:
Mechanisms for Specifying and Describing
the Format of Internet Message Bodies

Status of this Memo

This RFC specifies an Internet standards track protocol for the Internet community, and requests discussion and suggestions for improvements. Please refer to the current edition of the "Internet Official Protocol Standards" for the standardization state and status of this protocol. Distribution of this memo is unlimited.

Abstract

STD 11, RFC 822 defines a message representation protocol which specifies considerable detail about message headers, but which leaves the message content, or message body, as flat ASCII text. This document redefines the format of message bodies to allow multi-part textual and non-textual message bodies to be represented and exchanged without loss of information. This is based on earlier work documented in RFC 934 and STD 11, RFC 1049, but extends and revises that work. Because RFC 822 said so little about message bodies, this document is largely orthogonal to (rather than a revision of) RFC 822.

In particular, this document is designed to provide facilities to include multiple objects in a single message, to represent body text in character sets other than US-ASCII, to represent formatted multi-font text messages, to represent non-textual material such as images and audio fragments, and generally to facilitate later extensions defining new types of Internet mail for use by cooperating mail agents.

This document does NOT extend Internet mail header fields to permit anything other than US-ASCII text data. Such extensions are the subject of a companion document [RFC-1522].

This document is a revision of RFC 1341. Significant differences from RFC 1341 are summarized in Appendix H.

1. Introduction

Since its publication in 1982, STD 11, RFC 822 [RFC-822] has defined the standard format of textual mail messages on the Internet. Its success has been such that the RFC 822 format has been adopted, wholly or partially, well beyond the confines of the Internet and the Internet SMTP transport defined by STD 10, RFC 821 [RFC-821]. As the format has seen wider use, a number of limitations have proven increasingly restrictive for the user community.

RFC 822 was intended to specify a format for text messages. As such, non-text messages, such as multimedia messages that might include audio or images, are simply not mentioned. Even in the case of text, however, RFC 822 is inadequate for the needs of mail users whose languages require the use of character sets richer than US ASCII [US-ASCII]. Since RFC 822 does not specify mechanisms for mail containing audio, video, Asian language text, or even text in most European languages, additional specifications are needed.

One of the notable limitations of RFC 821/822 based mail systems is the fact that they limit the contents of electronic mail messages to relatively short lines of seven-bit ASCII. This forces users to convert any non-textual data that they may wish to send into seven-bit bytes representable as printable ASCII characters before invoking a local mail UA (User Agent, a program with which human users send and receive mail). Examples of such encodings currently used in the Internet include pure hexadecimal, uuencode, the 3-in-4 base 64 scheme specified in RFC 1421, the Andrew Toolkit Representation [ATK], and many others.

The limitations of RFC 822 mail become even more apparent as gateways are designed to allow for the exchange of mail messages between RFC 822 hosts and X.400 hosts. X.400 [X400] specifies mechanisms for the inclusion of non-textual body parts within electronic mail messages. The current standards for the mapping of X.400 messages to RFC 822 messages specify either that X.400 non-textual body parts must be converted to (not encoded in) an ASCII format, or that they must be discarded, notifying the RFC 822 user that discarding has occurred. This is clearly undesirable, as information that a user may wish to

RFC 1521 MIME September 1993

receive is lost. Even though a user's UA may not have the capability of dealing with the non-textual body part, the user might have some mechanism external to the UA that can extract useful information from the body part. Moreover, it does not allow for the fact that the message may eventually be gatewayed back into an X.400 message handling system (i.e., the X.400 message is "tunneled" through Internet mail), where the non-textual information would definitely become useful again.

This document describes several mechanisms that combine to solve most of these problems without introducing any serious incompatibilities with the existing world of RFC 822 mail. In particular, it describes:

1. A MIME-Version header field, which uses a version number to declare a message to be conformant with this specification and allows mail processing agents to distinguish between such messages and those generated by older or non-conformant software, which is presumed to lack such a field.

2. A Content-Type header field, generalized from RFC 1049 [RFC-1049], which can be used to specify the type and subtype of data in the body of a message and to fully specify the native representation (encoding) of such data.

2.a. A "text" Content-Type value, which can be used to represent textual information in a number of character sets and formatted text description languages in a standardized manner.

2.b. A "multipart" Content-Type value, which can be used to combine several body parts, possibly of differing types of data, into a single message.

2.c. An "application" Content-Type value, which can be used to transmit application data or binary data, and hence, among other uses, to implement an electronic mail file transfer service.

2.d. A "message" Content-Type value, for encapsulating another mail message.

2.e An "image" Content-Type value, for transmitting still image (picture) data.

2.f. An "audio" Content-Type value, for transmitting audio or voice data.

2.g. A "video" Content-Type value, for transmitting video or moving image data, possibly with audio as part of the composite video data format.

3. A Content-Transfer-Encoding header field, which can be used to specify an auxiliary encoding that was applied to the data in order to allow it to pass through mail transport mechanisms which may have data or character set limitations.

4. Two additional header fields that can be used to further describe the data in a message body, the Content-ID and Content-Description header fields.

MIME has been carefully designed as an extensible mechanism, and it is expected that the set of content-type/subtype pairs and their associated parameters will grow significantly with time. Several other MIME fields, notably including character set names, are likely to have new values defined over time. In order to ensure that the set of such values is developed in an orderly, well-specified, and public manner, MIME defines a registration process which uses the Internet Assigned Numbers Authority (IANA) as a central registry for such values. Appendix E provides details about how IANA registration is accomplished.

Finally, to specify and promote interoperability, Appendix A of this document provides a basic applicability statement for a subset of the above mechanisms that defines a minimal level of "conformance" with this document.

HISTORICAL NOTE: Several of the mechanisms described in this document may seem somewhat strange or even baroque at first reading. It is important to note that compatibility with existing standards AND robustness across existing practice were two of the highest priorities of the working group that developed this document. In particular, compatibility was always favored over elegance.

MIME was first defined and published as RFCs 1341 and 1342 [RFC-1341] [RFC-1342]. This document is a relatively minor updating of RFC 1341, and is intended to supersede it. The differences between this document and RFC 1341 are summarized in Appendix H. Please refer to the current edition of the "IAB Official Protocol Standards" for the standardization state and status of this protocol. Several other RFC documents will be of interest to the MIME implementor, in particular [RFC 1343], [RFC-1344], and [RFC-1345].

2. Notations, Conventions, and Generic BNF Grammar

This document is being published in two versions, one as plain ASCII text and one as PostScript (PostScript is a trademark of Adobe Systems Incorporated.). While the text version is the official specification, some will find the PostScript version easier to read. The textual contents are identical. An Andrew-format copy of this document is also available from the first author (Borenstein).

Although the mechanisms specified in this document are all described in prose, most are also described formally in the modified BNF notation of RFC 822. Implementors will need to be familiar with this notation in order to understand this specification, and are referred to RFC 822 for a complete explanation of the modified BNF notation.

Some of the modified BNF in this document makes reference to syntactic entities that are defined in RFC 822 and not in this document. A complete formal grammar, then, is obtained by combining the collected grammar appendix of this document with that of RFC 822 plus the modifications to RFC 822 defined in RFC 1123, which specifically changes the syntax for `return', `date' and `mailbox'.

The term CRLF, in this document, refers to the sequence of the two ASCII characters CR (13) and LF (10) which, taken together, in this order, denote a line break in RFC 822 mail.

The term "character set" is used in this document to refer to a method used with one or more tables to convert encoded text to a series of octets. This definition is intended to allow various kinds of text encodings, from simple single-table mappings such as ASCII to complex table switching methods such as those that use ISO 2022's techniques. However, a MIME character set name must fully specify the mapping to be performed.

The term "message", when not further qualified, means either the (complete or "top-level") message being transferred on a network, or a message encapsulated in a body of type "message".

The term "body part", in this document, means one of the parts of the body of a multipart entity. A body part has a header and a body, so it makes sense to speak about the body of a body part.

The term "entity", in this document, means either a message or a body part. All kinds of entities share the property that they have a header and a body.

The term "body", when not further qualified, means the body of an entity, that is the body of either a message or of a body part.

NOTE: The previous four definitions are clearly circular. This is unavoidable, since the overall structure of a MIME message is indeed recursive.

In this document, all numeric and octet values are given in decimal notation.

It must be noted that Content-Type values, subtypes, and parameter names as defined in this document are case-insensitive. However, parameter values are case-sensitive unless otherwise specified for the specific parameter.

FORMATTING NOTE: This document has been carefully formatted for ease of reading. The PostScript version of this document, in particular, places notes like this one, which may be skipped by the reader, in a smaller, italicized, font, and indents it as well. In the text version, only the indentation is preserved, so if you are reading the text version of this you might consider using the PostScript version instead. However, all such notes will be indented and preceded by "NOTE:" or some similar introduction, even in the text version.

The primary purpose of these non-essential notes is to convey information about the rationale of this document, or to place this document in the proper historical or evolutionary context. Such information may be skipped by those who are focused entirely on building a conformant implementation, but may be of use to those who wish to understand why this document is written as it is.

For ease of recognition, all BNF definitions have been placed in a fixed-width font in the PostScript version of this document.

3. The MIME-Version Header Field

Since RFC 822 was published in 1982, there has really been only one format standard for Internet messages, and there has been little perceived need to declare the format standard in use. This document is an independent document that complements RFC 822. Although the extensions in this document have been defined in such a way as to be compatible with RFC 822, there are still circumstances in which it might be desirable for a mail-processing agent to know whether a message was composed with the new standard in mind.

Therefore, this document defines a new header field, "MIME-Version", which is to be used to declare the version of the Internet message body format standard in use.

Messages composed in accordance with this document MUST include such

a header field, with the following verbatim text:

```
MIME-Version: 1.0
```

The presence of this header field is an assertion that the message has been composed in compliance with this document.

Since it is possible that a future document might extend the message format standard again, a formal BNF is given for the content of the MIME-Version field:

```
version := "MIME-Version" ":" 1*DIGIT "." 1*DIGIT
```

Thus, future format specifiers, which might replace or extend "1.0", are constrained to be two integer fields, separated by a period. If

a message is received with a MIME-version value other than "1.0", it cannot be assumed to conform with this specification.

Note that the MIME-Version header field is required at the top level of a message. It is not required for each body part of a multipart entity. It is required for the embedded headers of a body of type "message" if and only if the embedded message is itself claimed to be MIME-conformant.

It is not possible to fully specify how a mail reader that conforms with MIME as defined in this document should treat a message that might arrive in the future with some value of MIME-Version other than "1.0". However, conformant software is encouraged to check the version number and at least warn the user if an unrecognized MIME-version is encountered.

It is also worth noting that version control for specific content-types is not accomplished using the MIME-Version mechanism. In particular, some formats (such as application/postscript) have version numbering conventions that are internal to the document format. Where such conventions exist, MIME does nothing to supersede them. Where no such conventions exist, a MIME type might use a "version" parameter in the content-type field if necessary.

NOTE TO IMPLEMENTORS: All header fields defined in this document, including MIME-Version, Content-type, etc., are subject to the general syntactic rules for header fields specified in RFC 822. In particular, all can include comments, which means that the following two MIME-Version fields are equivalent:

MIME-Version: 1.0
MIME-Version: 1.0 (Generated by GBD-killer 3.7)

4. The Content-Type Header Field

The purpose of the Content-Type field is to describe the data contained in the body fully enough that the receiving user agent can pick an appropriate agent or mechanism to present the data to the user, or otherwise deal with the data in an appropriate manner.

HISTORICAL NOTE: The Content-Type header field was first defined in RFC 1049. RFC 1049 Content-types used a simpler and less powerful syntax, but one that is largely compatible with the mechanism given here.

The Content-Type header field is used to specify the nature of the data in the body of an entity, by giving type and subtype identifiers, and by providing auxiliary information that may be required for certain types. After the type and subtype names, the remainder of the header field is simply a set of parameters,

specified in an attribute/value notation. The set of meaningful parameters differs for the different types. In particular, there are NO globally-meaningful parameters that apply to all content-types. Global mechanisms are best addressed, in the MIME model, by the definition of additional Content-* header fields. The ordering of parameters is not significant. Among the defined parameters is a "charset" parameter by which the character set used in the body may be declared. Comments are allowed in accordance with RFC 822 rules for structured header fields.

In general, the top-level Content-Type is used to declare the general type of data, while the subtype specifies a specific format for that type of data. Thus, a Content-Type of "image/xyz" is enough to tell a user agent that the data is an image, even if the user agent has no knowledge of the specific image format "xyz". Such information can be used, for example, to decide whether or not to show a user the raw data from an unrecognized subtype -- such an action might be reasonable for unrecognized subtypes of text, but not for unrecognized subtypes of image or audio. For this reason, registered subtypes of audio, image, text, and video, should not contain embedded information that is really of a different type. Such compound types should be represented using the "multipart" or "application" types.

Parameters are modifiers of the content-subtype, and do not fundamentally affect the requirements of the host system. Although most parameters make sense only with certain content-types, others are "global" in the sense that they might apply to any subtype. For example, the "boundary" parameter makes sense only for the "multipart" content-type, but the "charset" parameter might make sense with several content-types.

An initial set of seven Content-Types is defined by this document. This set of top-level names is intended to be substantially complete. It is expected that additions to the larger set of supported types can generally be accomplished by the creation of new subtypes of these initial types. In the future, more top-level types may be defined only by an extension to this standard. If another primary type is to be used for any reason, it must be given a name starting with "X-" to indicate its non-standard status and to avoid a potential conflict with a future official name.

In the Augmented BNF notation of RFC 822, a Content-Type header field value is defined as follows:

```
content := "Content-Type" ":" type "/" subtype *(";"
parameter)
; case-insensitive matching of type and subtype
```

```
type := "application" / "audio"
/ "image" / "message"
/ "multipart" / "text"
/ "video" / extension-token
; All values case-insensitive

extension-token := x-token / iana-token

iana-token := <a publicly-defined extension token,
registered with IANA, as specified in
appendix E>

x-token := <The two characters "X-" or "x-" followed, with
no intervening white space, by any token>

subtype := token ; case-insensitive

parameter := attribute "=" value

attribute := token ; case-insensitive

value := token / quoted-string

token := 1*<any (ASCII) CHAR except SPACE, CTLs,
or tspecials>

tspecials := "(" / ")" / "<" / ">" / "@"
/ "," / ";" / ":" / "\" / <">
/ "/" / "[" / "]" / "?" / "="
; Must be in quoted-string,
; to use within parameter values
```

Note that the definition of "tspecials" is the same as the RFC 822 definition of "specials" with the addition of the three characters "/", "?", and "=", and the removal of ".".

Note also that a subtype specification is MANDATORY. There are no default subtypes.

The type, subtype, and parameter names are not case sensitive. For example, TEXT, Text, and TeXt are all equivalent. Parameter values are normally case sensitive, but certain parameters are interpreted to be case-insensitive, depending on the intended use. (For example, multipart boundaries are case-sensitive, but the "access-type" for message/External-body is not case-sensitive.)

Beyond this syntax, the only constraint on the definition of subtype names is the desire that their uses must not conflict. That is, it would be undesirable to have two different communities using "Content-Type: application/foobar" to mean two different things. The process of defining new content-subtypes, then, is not intended to be a mechanism for imposing restrictions, but simply a mechanism for

publicizing the usages. There are, therefore, two acceptable mechanisms for defining new Content-Type subtypes:

1. Private values (starting with "X-") may be defined bilaterally between two cooperating agents without outside registration or standardization.

2. New standard values must be documented, registered with, and approved by IANA, as described in Appendix E. Where intended for public use, the formats they refer to must also be defined by a published specification, and possibly offered for standardization.

The seven standard initial predefined Content-Types are detailed in the bulk of this document. They are:

text -- textual information. The primary subtype, "plain", indicates plain (unformatted) text. No special software is required to get the full meaning of the text, aside from support for the indicated character set. Subtypes are to be used for enriched text in forms where application software may enhance the appearance of the text, but such software must not be required in order to get the general idea of the content. Possible subtypes thus include any readable word processor

format. A very simple and portable subtype, richtext, was defined in RFC 1341, with a future revision expected.

multipart -- data consisting of multiple parts of independent data types. Four initial subtypes are defined, including the primary "mixed" subtype, "alternative" for representing the same data in multiple formats, "parallel" for parts intended to be viewed simultaneously, and "digest" for multipart entities in which each part is of type "message".

message -- an encapsulated message. A body of Content-Type "message" is itself all or part of a fully formatted RFC 822 conformant message which may contain its own different Content-Type header field. The primary subtype is "rfc822". The "partial" subtype is defined for partial messages, to permit the fragmented transmission of bodies

that are thought to be too large to be passed
through mail transport facilities. Another
subtype, "External-body", is defined for
specifying large bodies by reference to an
external data source.

image -- image data. Image requires a display device
(such as a graphical display, a printer, or a FAX
machine) to view the information. Initial
subtypes are defined for two widely-used image
formats, jpeg and gif.

audio -- audio data, with initial subtype "basic".
Audio requires an audio output device (such as a
speaker or a telephone) to "display" the contents.

video -- video data. Video requires the capability to
display moving images, typically including
specialized hardware and software. The initial
subtype is "mpeg".

application -- some other kind of data, typically
either uninterpreted binary data or information to
be processed by a mail-based application. The
primary subtype, "octet-stream", is to be used in
the case of uninterpreted binary data, in which
case the simplest recommended action is to offer
to write the information into a file for the user.

An additional subtype, "PostScript", is defined
for transporting PostScript documents in bodies.
Other expected uses for "application" include
spreadsheets, data for mail-based scheduling
systems, and languages for "active"
(computational) email. (Note that active email
and other application data may entail several
security considerations, which are discussed later
in this memo, particularly in the context of
application/PostScript.)

Default RFC 822 messages are typed by this protocol as plain text in
the US-ASCII character set, which can be explicitly specified as
"Content-type: text/plain; charset=us-ascii". If no Content-Type is
specified, this default is assumed. In the presence of a MIME-
Version header field, a receiving User Agent can also assume that
plain US-ASCII text was the sender's intent. In the absence of a
MIME-Version specification, plain US-ASCII text must still be
assumed, but the sender's intent might have been otherwise.

RATIONALE: In the absence of any Content-Type header field or MIME-Version header field, it is impossible to be certain that a message is actually text in the US-ASCII character set, since it might well be a message that, using the conventions that predate this document, includes text in another character set or non-textual data in a manner that cannot be automatically recognized (e.g., a uuencoded compressed UNIX tar file). Although there is no fully acceptable alternative to treating such untyped messages as "text/plain; charset=us-ascii", implementors should remain aware that if a message lacks both the MIME-Version and the Content-Type header fields, it may in practice contain almost anything.

It should be noted that the list of Content-Type values given here may be augmented in time, via the mechanisms described above, and that the set of subtypes is expected to grow substantially.

When a mail reader encounters mail with an unknown Content-type value, it should generally treat it as equivalent to "application/octet-stream", as described later in this document.

5. The Content-Transfer-Encoding Header Field

Many Content-Types which could usefully be transported via email are represented, in their "natural" format, as 8-bit character or binary data. Such data cannot be transmitted over some transport protocols. For example, RFC 821 restricts mail messages to 7-bit US-ASCII data with lines no longer than 1000 characters.

It is necessary, therefore, to define a standard mechanism for re-encoding such data into a 7-bit short-line format. This document specifies that such encodings will be indicated by a new "Content-Transfer-Encoding" header field. The Content-Transfer-Encoding field is used to indicate the type of transformation that has been used in order to represent the body in an acceptable manner for transport.

Unlike Content-Types, a proliferation of Content-Transfer-Encoding values is undesirable and unnecessary. However, establishing only a single Content-Transfer-Encoding mechanism does not seem possible. There is a tradeoff between the desire for a compact and efficient encoding of largely-binary data and the desire for a readable encoding of data that is mostly, but not entirely, 7-bit data. For this reason, at least two encoding mechanisms are necessary: a "readable" encoding and a "dense" encoding.

The Content-Transfer-Encoding field is designed to specify an invertible mapping between the "native" representation of a type of data and a representation that can be readily exchanged using 7 bit mail transport protocols, such as those defined by RFC 821 (SMTP). This field has not been defined by any previous standard. The field's

value is a single token specifying the type of encoding, as
enumerated below. Formally:

encoding := "Content-Transfer-Encoding" ":" mechanism

mechanism := "7bit" ; case-insensitive
/ "quoted-printable"
/ "base64"
/ "8bit"
/ "binary"
/ x-token

These values are not case sensitive. That is, Base64 and BASE64 and
bAsE64 are all equivalent. An encoding type of 7BIT requires that
the body is already in a seven-bit mail-ready representation. This
is the default value -- that is, "Content-Transfer-Encoding: 7BIT" is
assumed if the Content-Transfer-Encoding header field is not present.

The values "8bit", "7bit", and "binary" all mean that NO encoding has
been performed. However, they are potentially useful as indications
of the kind of data contained in the object, and therefore of the
kind of encoding that might need to be performed for transmission in
a given transport system. In particular:

"7bit" means that the data is all represented as short
lines of US-ASCII data.

"8bit" means that the lines are short, but there may be
non-ASCII characters (octets with the high-order
bit set).

"Binary" means that not only may non-ASCII characters
be present, but also that the lines are not
necessarily short enough for SMTP transport.

The difference between "8bit" (or any other conceivable bit-width
token) and the "binary" token is that "binary" does not require
adherence to any limits on line length or to the SMTP CRLF semantics,
while the bit-width tokens do require such adherence. If the body
contains data in any bit-width other than 7-bit, the appropriate
bit-width Content-Transfer-Encoding token must be used (e.g., "8bit"
for unencoded 8 bit wide data). If the body contains binary data,
the "binary" Content-Transfer-Encoding token must be used.

NOTE: The distinction between the Content-Transfer-Encoding values
of "binary", "8bit", etc. may seem unimportant, in that all of
them really mean "none" -- that is, there has been no encoding of
the data for transport. However, clear labeling will be of
enormous value to gateways between future mail transport systems
with differing capabilities in transporting data that do not meet

the restrictions of RFC 821 transport.

Mail transport for unencoded 8-bit data is defined in RFC-1426 [RFC-1426]. As of the publication of this document, there are no standardized Internet mail transports for which it is legitimate to include unencoded binary data in mail bodies. Thus there are no circumstances in which the "binary" Content-Transfer-Encoding is actually legal on the Internet. However, in the event that binary mail transport becomes a reality in Internet mail, or when this document is used in conjunction with any other binary-capable transport mechanism, binary bodies should be labeled as such using this mechanism.

NOTE: The five values defined for the Content-Transfer-Encoding field imply nothing about the Content-Type other than the algorithm by which it was encoded or the transport system requirements if unencoded.

Implementors may, if necessary, define new Content-Transfer-Encoding values, but must use an x-token, which is a name prefixed by "X-" to indicate its non-standard status, e.g., "Content-Transfer-Encoding: x-my-new-encoding". However, unlike Content-Types and subtypes, the creation of new Content-Transfer-Encoding values is explicitly and strongly discouraged, as it seems likely to hinder interoperability with little potential benefit. Their use is allowed only as the

result of an agreement between cooperating user agents.

If a Content-Transfer-Encoding header field appears as part of a message header, it applies to the entire body of that message. If a Content-Transfer-Encoding header field appears as part of a body part's headers, it applies only to the body of that body part. If an entity is of type "multipart" or "message", the Content-Transfer-Encoding is not permitted to have any value other than a bit width (e.g., "7bit", "8bit", etc.) or "binary".

It should be noted that email is character-oriented, so that the mechanisms described here are mechanisms for encoding arbitrary octet streams, not bit streams. If a bit stream is to be encoded via one of these mechanisms, it must first be converted to an 8-bit byte stream using the network standard bit order ("big-endian"), in which the earlier bits in a stream become the higher-order bits in a byte. A bit stream not ending at an 8-bit boundary must be padded with zeroes. This document provides a mechanism for noting the addition of such padding in the case of the application Content-Type, which has a "padding" parameter.

The encoding mechanisms defined here explicitly encode all data in ASCII. Thus, for example, suppose an entity has header fields such

as:

```
Content-Type: text/plain; charset=ISO-8859-1
Content-transfer-encoding: base64
```

This must be interpreted to mean that the body is a base64 ASCII encoding of data that was originally in ISO-8859-1, and will be in that character set again after decoding.

The following sections will define the two standard encoding mechanisms. The definition of new content-transfer-encodings is explicitly discouraged and should only occur when absolutely necessary. All content-transfer-encoding namespace except that beginning with "X-" is explicitly reserved to the IANA for future use. Private agreements about content-transfer-encodings are also explicitly discouraged.

Certain Content-Transfer-Encoding values may only be used on certain Content-Types. In particular, it is expressly forbidden to use any encodings other than "7bit", "8bit", or "binary" with any Content-Type that recursively includes other Content-Type fields, notably the "multipart" and "message" Content-Types. All encodings that are desired for bodies of type multipart or message must be done at the innermost level, by encoding the actual body that needs to be encoded.

NOTE ON ENCODING RESTRICTIONS: Though the prohibition against using content-transfer-encodings on data of type multipart or message may seem overly restrictive, it is necessary to prevent nested encodings, in which data are passed through an encoding algorithm multiple times, and must be decoded multiple times in order to be properly viewed. Nested encodings add considerable complexity to user agents: aside from the obvious efficiency problems with such multiple encodings, they can obscure the basic structure of a message. In particular, they can imply that several decoding operations are necessary simply to find out what types of objects a message contains. Banning nested encodings may complicate the job of certain mail gateways, but this seems less of a problem than the effect of nested encodings on user agents.

NOTE ON THE RELATIONSHIP BETWEEN CONTENT-TYPE AND CONTENT-TRANSFER-ENCODING: It may seem that the Content-Transfer-Encoding could be inferred from the characteristics of the Content-Type that is to be encoded, or, at the very least, that certain Content-Transfer-Encodings could be mandated for use with specific Content-Types. There are several reasons why this is not the case. First, given the varying types of transports used for mail, some encodings may be appropriate for some Content-Type/transport combinations and not for others. (For example, in an 8-bit

transport, no encoding would be required for text in certain character sets, while such encodings are clearly required for 7-bit SMTP.) Second, certain Content-Types may require different types of transfer encoding under different circumstances. For example, many PostScript bodies might consist entirely of short lines of 7-bit data and hence require little or no encoding. Other PostScript bodies (especially those using Level 2 PostScript's binary encoding mechanism) may only be reasonably represented using a binary transport encoding. Finally, since Content-Type is intended to be an open-ended specification mechanism, strict specification of an association between Content-Types and encodings effectively couples the specification of an application protocol with a specific lower-level transport. This is not desirable since the developers of a Content-Type should not have to be aware of all the transports in use and what their limitations are.

NOTE ON TRANSLATING ENCODINGS: The quoted-printable and base64 encodings are designed so that conversion between them is possible. The only issue that arises in such a conversion is the handling of line breaks. When converting from quoted-printable to base64 a line break must be converted into a CRLF sequence. Similarly, a CRLF sequence in base64 data must be converted to a quoted-printable line break, but ONLY when converting text data.

NOTE ON CANONICAL ENCODING MODEL: There was some confusion, in earlier drafts of this memo, regarding the model for when email data was to be converted to canonical form and encoded, and in particular how this process would affect the treatment of CRLFs, given that the representation of newlines varies greatly from system to system, and the relationship between content-transfer-encodings and character sets. For this reason, a canonical model for encoding is presented as Appendix G.

5.1. Quoted-Printable Content-Transfer-Encoding

The Quoted-Printable encoding is intended to represent data that largely consists of octets that correspond to printable characters in the ASCII character set. It encodes the data in such a way that the resulting octets are unlikely to be modified by mail transport. If the data being encoded are mostly ASCII text, the encoded form of the data remains largely recognizable by humans. A body which is entirely ASCII may also be encoded in Quoted-Printable to ensure the integrity of the data should the message pass through a character-translating, and/or line-wrapping gateway.

In this encoding, octets are to be represented as determined by the following rules:

Rule #1: (General 8-bit representation) Any octet, except those indicating a line break according to the newline convention of the canonical (standard) form of the data being encoded, may be represented by an "=" followed by a two digit hexadecimal representation of the octet's value. The digits of the hexadecimal alphabet, for this purpose, are "0123456789ABCDEF". Uppercase letters must be used when sending hexadecimal data, though a robust implementation may choose to recognize lowercase letters on receipt. Thus, for example, the value 12 (ASCII form feed) can be represented by "=0C", and the value 61 (ASCII EQUAL SIGN) can be represented by "=3D". Except when the following rules allow an alternative encoding, this rule is mandatory.

Rule #2: (Literal representation) Octets with decimal values of 33 through 60 inclusive, and 62 through 126, inclusive, MAY be represented as the ASCII characters which correspond to those octets (EXCLAMATION POINT through LESS THAN, and GREATER THAN through TILDE, respectively).

Rule #3: (White Space): Octets with values of 9 and 32 MAY be represented as ASCII TAB (HT) and SPACE characters, respectively, but MUST NOT be so represented at the end of an encoded line. Any TAB (HT) or SPACE characters on an encoded line MUST thus be followed on that line by a printable character. In particular, an

"=" at the end of an encoded line, indicating a soft line break (see rule #5) may follow one or more TAB (HT) or SPACE characters. It follows that an octet with value 9 or 32 appearing at the end of an encoded line must be represented according to Rule #1. This rule is necessary because some MTAs (Message Transport Agents, programs which transport messages from one user to another, or perform a part of such transfers) are known to pad lines of text with SPACEs, and others are known to remove "white space" characters from the end of a line. Therefore, when decoding a Quoted-Printable body, any trailing white space on a line must be deleted, as it will necessarily have been added by intermediate transport agents.

Rule #4 (Line Breaks): A line break in a text body, independent of what its representation is following the canonical representation of the data being encoded, must be represented by a (RFC 822) line break, which is a CRLF sequence, in the Quoted-Printable encoding. Since the canonical representation of types other than text do not generally include the representation of line breaks, no hard line breaks (i.e. line breaks that are intended to be meaningful and to be displayed to the user) should occur in the quoted-printable encoding of such types. Of course, occurrences of "=0D", "=0A", "0A=0D" and "=0D=0A" will eventually be encountered. In general, however, base64 is preferred over quoted-printable for binary

data.

Note that many implementations may elect to encode the local representation of various content types directly, as described in Appendix G. In particular, this may apply to plain text material on systems that use newline conventions other than CRLF delimiters. Such an implementation is permissible, but the generation of line breaks must be generalized to account for the case where alternate representations of newline sequences are used.

Rule #5 (Soft Line Breaks): The Quoted-Printable encoding REQUIRES that encoded lines be no more than 76 characters long. If longer lines are to be encoded with the Quoted-Printable encoding, 'soft' line breaks must be used. An equal sign as the last character on a encoded line indicates such a non-significant ('soft') line break in the encoded text. Thus if the "raw" form of the line is a single unencoded line that says:

Now's the time for all folk to come to the aid of
their country.

This can be represented, in the Quoted-Printable encoding, as

```
Now's the time =
for all folk to come=
to the aid of their country.
```

This provides a mechanism with which long lines are encoded in such a way as to be restored by the user agent. The 76 character limit does not count the trailing CRLF, but counts all other characters, including any equal signs.

Since the hyphen character ("-") is represented as itself in the Quoted-Printable encoding, care must be taken, when encapsulating a quoted-printable encoded body in a multipart entity, to ensure that the encapsulation boundary does not appear anywhere in the encoded body. (A good strategy is to choose a boundary that includes a character sequence such as "=_" which can never appear in a quoted-printable body. See the definition of multipart messages later in this document.)

NOTE: The quoted-printable encoding represents something of a compromise between readability and reliability in transport. Bodies encoded with the quoted-printable encoding will work reliably over most mail gateways, but may not work perfectly over a few gateways, notably those involving translation into EBCDIC. (In theory, an EBCDIC gateway could decode a quoted-printable body and re-encode it using base64, but such gateways do not yet

exist.) A higher level of confidence is offered by the base64 Content-Transfer-Encoding. A way to get reasonably reliable transport through EBCDIC gateways is to also quote the ASCII characters

!"#$@[\]^`{|}~

according to rule #1. See Appendix B for more information.

Because quoted-printable data is generally assumed to be line-oriented, it is to be expected that the representation of the breaks between the lines of quoted printable data may be altered in transport, in the same manner that plain text mail has always been altered in Internet mail when passing between systems with differing newline conventions. If such alterations are likely to constitute a corruption of the data, it is probably more sensible to use the base64 encoding rather than the quoted-printable encoding.

WARNING TO IMPLEMENTORS: If binary data are encoded in quoted-printable, care must be taken to encode CR and LF characters as "=0D" and "=0A", respectively. In particular, a CRLF sequence in binary data should be encoded as "=0D=0A". Otherwise, if CRLF were represented as a hard line break, it might be incorrectly decoded on

platforms with different line break conventions.

For formalists, the syntax of quoted-printable data is described by the following grammar:

```
quoted-printable := ([*(ptext / SPACE / TAB) ptext] ["="] CRLF)
; Maximum line length of 76 characters excluding CRLF

ptext := octet /<any ASCII character except "=", SPACE, or TAB>
; characters not listed as "mail-safe" in Appendix B
; are also not recommended.

octet := "=" 2(DIGIT / "A" / "B" / "C" / "D" / "E" / "F")
; octet must be used for characters > 127, =, SPACE, or TAB,
; and is recommended for any characters not listed in
; Appendix B as "mail-safe".
```

5.2. Base64 Content-Transfer-Encoding

The Base64 Content-Transfer-Encoding is designed to represent arbitrary sequences of octets in a form that need not be humanly readable. The encoding and decoding algorithms are simple, but the encoded data are consistently only about 33 percent larger than the unencoded data. This encoding is virtually identical to the one used in Privacy Enhanced Mail (PEM) applications, as defined in RFC 1421. The base64 encoding is adapted from RFC 1421, with one change: base64

eliminates the "*" mechanism for embedded clear text.

A 65-character subset of US-ASCII is used, enabling 6 bits to be represented per printable character. (The extra 65th character, "=", is used to signify a special processing function.)

NOTE: This subset has the important property that it is represented identically in all versions of ISO 646, including US ASCII, and all characters in the subset are also represented identically in all versions of EBCDIC. Other popular encodings, such as the encoding used by the uuencode utility and the base85 encoding specified as part of Level 2 PostScript, do not share these properties, and thus do not fulfill the portability requirements a binary transport encoding for mail must meet.

The encoding process represents 24-bit groups of input bits as output strings of 4 encoded characters. Proceeding from left to right, a 24-bit input group is formed by concatenating 3 8-bit input groups. These 24 bits are then treated as 4 concatenated 6-bit groups, each of which is translated into a single digit in the base64 alphabet. When encoding a bit stream via the base64 encoding, the bit stream must be presumed to be ordered with the most-significant-bit first.

That is, the first bit in the stream will be the high-order bit in the first byte, and the eighth bit will be the low-order bit in the first byte, and so on.

Each 6-bit group is used as an index into an array of 64 printable characters. The character referenced by the index is placed in the output string. These characters, identified in Table 1, below, are selected so as to be universally representable, and the set excludes characters with particular significance to SMTP (e.g., ".", CR, LF) and to the encapsulation boundaries defined in this document (e.g., "-").

Table 1: The Base64 Alphabet

Value	Encoding	Value	Encoding	Value	Encoding	Value	Encoding
0	A	17	R	34	i	51	z
1	B	18	S	35	j	52	0
2	C	19	T	36	k	53	1
3	D	20	U	37	l	54	2
4	E	21	V	38	m	55	3
5	F	22	W	39	n	56	4
6	G	23	X	40	o	57	5
7	H	24	Y	41	p	58	6
8	I	25	Z	42	q	59	7
9	J	26	a	43	r	60	8
10	K	27	b	44	s	61	9

11 L 28 c 45 t 62 +
12 M 29 d 46 u 63 /
13 N 30 e 47 v
14 O 31 f 48 w (pad) =
15 P 32 g 49 x
16 Q 33 h 50 y

The output stream (encoded bytes) must be represented in lines of no more than 76 characters each. All line breaks or other characters not found in Table 1 must be ignored by decoding software. In base64 data, characters other than those in Table 1, line breaks, and other white space probably indicate a transmission error, about which a warning message or even a message rejection might be appropriate under some circumstances.

Special processing is performed if fewer than 24 bits are available at the end of the data being encoded. A full encoding quantum is always completed at the end of a body. When fewer than 24 input bits are available in an input group, zero bits are added (on the right) to form an integral number of 6-bit groups. Padding at the end of the data is performed using the '=' character. Since all base64 input is an integral number of octets, only the following cases can

arise: (1) the final quantum of encoding input is an integral multiple of 24 bits; here, the final unit of encoded output will be an integral multiple of 4 characters with no "=" padding, (2) the final quantum of encoding input is exactly 8 bits; here, the final unit of encoded output will be two characters followed by two "=" padding characters, or (3) the final quantum of encoding input is exactly 16 bits; here, the final unit of encoded output will be three characters followed by one "=" padding character.

Because it is used only for padding at the end of the data, the occurrence of any '=' characters may be taken as evidence that the end of the data has been reached (without truncation in transit). No such assurance is possible, however, when the number of octets transmitted was a multiple of three.

Any characters outside of the base64 alphabet are to be ignored in base64-encoded data. The same applies to any illegal sequence of characters in the base64 encoding, such as "====="

Care must be taken to use the proper octets for line breaks if base64 encoding is applied directly to text material that has not been converted to canonical form. In particular, text line breaks must be converted into CRLF sequences prior to base64 encoding. The important thing to note is that this may be done directly by the encoder rather than in a prior canonicalization step in some implementations.

NOTE: There is no need to worry about quoting apparent encapsulation boundaries within base64-encoded parts of multipart entities because no hyphen characters are used in the base64 encoding.

6. Additional Content-Header Fields

6.1. Optional Content-ID Header Field

In constructing a high-level user agent, it may be desirable to allow one body to make reference to another. Accordingly, bodies may be labeled using the "Content-ID" header field, which is syntactically identical to the "Message-ID" header field:

id := "Content-ID" ":" msg-id
Like the Message-ID values, Content-ID values must be generated to be world-unique.

The Content-ID value may be used for uniquely identifying MIME entities in several contexts, particularly for cacheing data referenced by the message/external-body mechanism. Although the Content-ID header is generally optional, its use is mandatory in

implementations which generate data of the optional MIME Content-type "message/external-body". That is, each message/external-body entity must have a Content-ID field to permit cacheing of such data.

It is also worth noting that the Content-ID value has special semantics in the case of the multipart/alternative content-type. This is explained in the section of this document dealing with multipart/alternative.

6.2. Optional Content-Description Header Field

The ability to associate some descriptive information with a given body is often desirable. For example, it may be useful to mark an "image" body as "a picture of the Space Shuttle Endeavor." Such text may be placed in the Content-Description header field.

description := "Content-Description" ":" *text

The description is presumed to be given in the US-ASCII character set, although the mechanism specified in [RFC-1522] may be used for non-US-ASCII Content-Description values.

7. The Predefined Content-Type Values

This document defines seven initial Content-Type values and an extension mechanism for private or experimental types. Further standard types must be defined by new published specifications. It is expected that most innovation in new types of mail will take place as subtypes of the seven types defined here. The most essential

characteristics of the seven content-types are summarized in Appendix F.

7.1 The Text Content-Type

The text Content-Type is intended for sending material which is principally textual in form. It is the default Content-Type. A "charset" parameter may be used to indicate the character set of the body text for some text subtypes, notably including the primary subtype, "text/plain", which indicates plain (unformatted) text. The default Content-Type for Internet mail is "text/plain; charset=us-ascii".

Beyond plain text, there are many formats for representing what might be known as "extended text" -- text with embedded formatting and presentation information. An interesting characteristic of many such representations is that they are to some extent readable even without the software that interprets them. It is useful, then, to distinguish them, at the highest level, from such unreadable data as

images, audio, or text represented in an unreadable form. In the absence of appropriate interpretation software, it is reasonable to show subtypes of text to the user, while it is not reasonable to do so with most nontextual data.

Such formatted textual data should be represented using subtypes of text. Plausible subtypes of text are typically given by the common name of the representation format, e.g., "text/richtext" [RFC-1341].

7.1.1. The charset parameter

A critical parameter that may be specified in the Content-Type field for text/plain data is the character set. This is specified with a "charset" parameter, as in:

Content-type: text/plain; charset=us-ascii

Unlike some other parameter values, the values of the charset parameter are NOT case sensitive. The default character set, which must be assumed in the absence of a charset parameter, is US-ASCII.

The specification for any future subtypes of "text" must specify whether or not they will also utilize a "charset" parameter, and may possibly restrict its values as well. When used with a particular body, the semantics of the "charset" parameter should be identical to those specified here for "text/plain", i.e., the body consists entirely of characters in the given charset. In particular, definers of future text subtypes should pay close attention the the implications of multibyte character sets for their subtype definitions.

This RFC specifies the definition of the charset parameter for the purposes of MIME to be a unique mapping of a byte stream to glyphs, a mapping which does not require external profiling information.

An initial list of predefined character set names can be found at the end of this section. Additional character sets may be registered with IANA, although the standardization of their use requires the usual IESG [RFC-1340] review and approval. Note that if the specified character set includes 8-bit data, a Content-Transfer-Encoding header field and a corresponding encoding on the data are required in order to transmit the body via some mail transfer protocols, such as SMTP.

The default character set, US-ASCII, has been the subject of some confusion and ambiguity in the past. Not only were there some ambiguities in the definition, there have been wide variations in practice. In order to eliminate such ambiguity and variations in the

future, it is strongly recommended that new user agents explicitly specify a character set via the Content-Type header field. "US-ASCII" does not indicate an arbitrary seven-bit character code, but specifies that the body uses character coding that uses the exact correspondence of codes to characters specified in ASCII. National use variations of ISO 646 [ISO-646] are NOT ASCII and their use in Internet mail is explicitly discouraged. The omission of the ISO 646 character set is deliberate in this regard. The character set name of "US-ASCII" explicitly refers to ANSI X3.4-1986 [US-ASCII] only. The character set name "ASCII" is reserved and must not be used for any purpose.

NOTE: RFC 821 explicitly specifies "ASCII", and references an earlier version of the American Standard. Insofar as one of the purposes of specifying a Content-Type and character set is to permit the receiver to unambiguously determine how the sender intended the coded message to be interpreted, assuming anything other than "strict ASCII" as the default would risk unintentional and incompatible changes to the semantics of messages now being transmitted. This also implies that messages containing characters coded according to national variations on ISO 646, or using code-switching procedures (e.g., those of ISO 2022), as well as 8-bit or multiple octet character encodings MUST use an appropriate character set specification to be consistent with this specification.

The complete US-ASCII character set is listed in [US-ASCII]. Note that the control characters including DEL (0-31, 127) have no defined meaning apart from the combination CRLF (ASCII values 13 and 10) indicating a new line. Two of the characters have de facto meanings in wide use: FF (12) often means "start subsequent text on the

beginning of a new page"; and TAB or HT (9) often (though not always) means "move the cursor to the next available column after the current position where the column number is a multiple of 8 (counting the first column as column 0)." Apart from this, any use of the control characters or DEL in a body must be part of a private agreement between the sender and recipient. Such private agreements are discouraged and should be replaced by the other capabilities of this document.

NOTE: Beyond US-ASCII, an enormous proliferation of character sets is possible. It is the opinion of the IETF working group that a large number of character sets is NOT a good thing. We would prefer to specify a single character set that can be used universally for representing all of the world's languages in electronic mail. Unfortunately, existing practice in several communities seems to point to the continued use of multiple character sets in the near future. For this reason, we define

names for a small number of character sets for which a strong constituent base exists.

The defined charset values are:

US-ASCII -- as defined in [US-ASCII].

ISO-8859-X -- where "X" is to be replaced, as necessary, for the parts of ISO-8859 [ISO-8859]. Note that the ISO 646 character sets have deliberately been omitted in favor of their 8859 replacements, which are the designated character sets for Internet mail. As of the publication of this document, the legitimate values for "X" are the digits 1 through 9.

The character sets specified above are the ones that were relatively uncontroversial during the drafting of MIME. This document does not endorse the use of any particular character set other than US-ASCII, and recognizes that the future evolution of world character sets remains unclear. It is expected that in the future, additional character sets will be registered for use in MIME.

Note that the character set used, if anything other than US-ASCII, must always be explicitly specified in the Content-Type field.

No other character set name may be used in Internet mail without the publication of a formal specification and its registration with IANA, or by private agreement, in which case the character set name must begin with "X-".

Implementors are discouraged from defining new character sets for mail use unless absolutely necessary.

The "charset" parameter has been defined primarily for the purpose of textual data, and is described in this section for that reason. However, it is conceivable that non-textual data might also wish to specify a charset value for some purpose, in which case the same syntax and values should be used.

In general, mail-sending software must always use the "lowest common denominator" character set possible. For example, if a body contains only US-ASCII characters, it must be marked as being in the US-ASCII character set, not ISO-8859-1, which, like all the ISO-8859 family of character sets, is a superset of US-ASCII. More generally, if a widely-used character set is a subset of another character set, and a body contains only characters in the widely-used subset, it must be labeled as being in that subset. This will increase the chances that the recipient will be able to view the mail correctly.

7.1.2. The Text/plain subtype

The primary subtype of text is "plain". This indicates plain (unformatted) text. The default Content-Type for Internet mail, "text/plain; charset=us-ascii", describes existing Internet practice. That is, it is the type of body defined by RFC 822.

No other text subtype is defined by this document.

The formal grammar for the content-type header field for text is as follows:

```
text-type := "text" "/" text-subtype [";" "charset" "=" charset]

text-subtype := "plain" / extension-token

charset := "us-ascii"/ "iso-8859-1"/ "iso-8859-2"/ "iso-8859-3"
/ "iso-8859-4"/ "iso-8859-5"/ "iso-8859-6"/ "iso-8859-7"
/ "iso-8859-8" / "iso-8859-9" / extension-token
; case insensitive
```

7.2. The Multipart Content-Type

In the case of multiple part entities, in which one or more different sets of data are combined in a single body, a "multipart" Content-Type field must appear in the entity's header. The body must then contain one or more "body parts," each preceded by an encapsulation boundary, and the last one followed by a closing boundary. Each part starts with an encapsulation boundary, and then contains a body part consisting of header area, a blank line, and a body area. Thus a body part is similar to an RFC 822 message in syntax, but different in meaning.

A body part is NOT to be interpreted as actually being an RFC 822 message. To begin with, NO header fields are actually required in

body parts. A body part that starts with a blank line, therefore, is allowed and is a body part for which all default values are to be assumed. In such a case, the absence of a Content-Type header field implies that the corresponding body is plain US-ASCII text. The only header fields that have defined meaning for body parts are those the names of which begin with "Content-". All other header fields are generally to be ignored in body parts. Although they should generally be retained in mail processing, they may be discarded by gateways if necessary. Such other fields are permitted to appear in body parts but must not be depended on. "X-" fields may be created for experimental or private purposes, with the recognition that the information they contain may be lost at some gateways.

NOTE: The distinction between an RFC 822 message and a body part is subtle, but important. A gateway between Internet and X.400 mail, for example, must be able to tell the difference between a body part that contains an image and a body part that contains an encapsulated message, the body of which is an image. In order to represent the latter, the body part must have "Content-Type: message", and its body (after the blank line) must be the encapsulated message, with its own "Content-Type: image" header field. The use of similar syntax facilitates the conversion of messages to body parts, and vice versa, but the distinction between the two must be understood by implementors. (For the special case in which all parts actually are messages, a "digest" subtype is also defined.)

As stated previously, each body part is preceded by an encapsulation boundary. The encapsulation boundary MUST NOT appear inside any of the encapsulated parts. Thus, it is crucial that the composing agent be able to choose and specify the unique boundary that will separate the parts.

All present and future subtypes of the "multipart" type must use an identical syntax. Subtypes may differ in their semantics, and may impose additional restrictions on syntax, but must conform to the required syntax for the multipart type. This requirement ensures that all conformant user agents will at least be able to recognize and separate the parts of any multipart entity, even of an unrecognized subtype.

As stated in the definition of the Content-Transfer-Encoding field, no encoding other than "7bit", "8bit", or "binary" is permitted for entities of type "multipart". The multipart delimiters and header fields are always represented as 7-bit ASCII in any case (though the header fields may encode non-ASCII header text as per [RFC-1522]), and data within the body parts can be encoded on a part-by-part basis, with Content-Transfer-Encoding fields for each appropriate

body part.

Mail gateways, relays, and other mail handling agents are commonly known to alter the top-level header of an RFC 822 message. In particular, they frequently add, remove, or reorder header fields. Such alterations are explicitly forbidden for the body part headers embedded in the bodies of messages of type "multipart."

7.2.1. Multipart: The common syntax

All subtypes of "multipart" share a common syntax, defined in this section. A simple example of a multipart message also appears in this section. An example of a more complex multipart message is

given in Appendix C.

The Content-Type field for multipart entities requires one parameter, "boundary", which is used to specify the encapsulation boundary. The encapsulation boundary is defined as a line consisting entirely of two hyphen characters ("-", decimal code 45) followed by the boundary parameter value from the Content-Type header field.

NOTE: The hyphens are for rough compatibility with the earlier RFC 934 method of message encapsulation, and for ease of searching for the boundaries in some implementations. However, it should be noted that multipart messages are NOT completely compatible with RFC 934 encapsulations; in particular, they do not obey RFC 934 quoting conventions for embedded lines that begin with hyphens. This mechanism was chosen over the RFC 934 mechanism because the latter causes lines to grow with each level of quoting. The combination of this growth with the fact that SMTP implementations sometimes wrap long lines made the RFC 934 mechanism unsuitable for use in the event that deeply-nested multipart structuring is ever desired.

WARNING TO IMPLEMENTORS: The grammar for parameters on the Content-type field is such that it is often necessary to enclose the boundaries in quotes on the Content-type line. This is not always necessary, but never hurts. Implementors should be sure to study the grammar carefully in order to avoid producing illegal Content-type fields. Thus, a typical multipart Content-Type header field might look like this:

Content-Type: multipart/mixed;
boundary=gc0p4Jq0M2Yt08jU534c0p

But the following is illegal:

Content-Type: multipart/mixed;
boundary=gc0p4Jq0M:2Yt08jU534c0p

(because of the colon) and must instead be represented as

Content-Type: multipart/mixed;
boundary="gc0p4Jq0M:2Yt08jU534c0p"

This indicates that the entity consists of several parts, each itself with a structure that is syntactically identical to an RFC 822 message, except that the header area might be completely empty, and that the parts are each preceded by the line

--gc0p4Jq0M:2Yt08jU534c0p

Note that the encapsulation boundary must occur at the beginning of a line, i.e., following a CRLF, and that the initial CRLF is considered to be attached to the encapsulation boundary rather than part of the preceding part. The boundary must be followed immediately either by another CRLF and the header fields for the next part, or by two CRLFs, in which case there are no header fields for the next part (and it is therefore assumed to be of Content-Type text/plain).

NOTE: The CRLF preceding the encapsulation line is conceptually attached to the boundary so that it is possible to have a part that does not end with a CRLF (line break). Body parts that must be considered to end with line breaks, therefore, must have two CRLFs preceding the encapsulation line, the first of which is part of the preceding body part, and the second of which is part of the encapsulation boundary.

Encapsulation boundaries must not appear within the encapsulations, and must be no longer than 70 characters, not counting the two leading hyphens.

The encapsulation boundary following the last body part is a distinguished delimiter that indicates that no further body parts will follow. Such a delimiter is identical to the previous delimiters, with the addition of two more hyphens at the end of the line:

--gc0p4Jq0M2Yt08jU534c0p--

There appears to be room for additional information prior to the first encapsulation boundary and following the final boundary. These areas should generally be left blank, and implementations must ignore anything that appears before the first boundary or after the last one.

NOTE: These "preamble" and "epilogue" areas are generally not used because of the lack of proper typing of these parts and the lack of clear semantics for handling these areas at gateways, particularly X.400 gateways. However, rather than leaving the preamble area blank, many MIME implementations have found this to

be a convenient place to insert an explanatory note for recipients
who read the message with pre-MIME software, since such notes will
be ignored by MIME-compliant software.

NOTE: Because encapsulation boundaries must not appear in the body
parts being encapsulated, a user agent must exercise care to
choose a unique boundary. The boundary in the example above could
have been the result of an algorithm designed to produce
boundaries with a very low probability of already existing in the

data to be encapsulated without having to prescan the data.
Alternate algorithms might result in more 'readable' boundaries
for a recipient with an old user agent, but would require more
attention to the possibility that the boundary might appear in the
encapsulated part. The simplest boundary possible is something
like "---", with a closing boundary of "-----".

As a very simple example, the following multipart message has two
parts, both of them plain text, one of them explicitly typed and one
of them implicitly typed:

```
From: Nathaniel Borenstein <nsb@bellcore.com>
To: Ned Freed <ned@innosoft.com>
Subject: Sample message
MIME-Version: 1.0
Content-type: multipart/mixed; boundary="simple
boundary"

This is the preamble. It is to be ignored, though it
is a handy place for mail composers to include an
explanatory note to non-MIME conformant readers.
--simple boundary

This is implicitly typed plain ASCII text.
It does NOT end with a linebreak.
--simple boundary
Content-type: text/plain; charset=us-ascii

This is explicitly typed plain ASCII text.
It DOES end with a linebreak.

--simple boundary--
This is the epilogue. It is also to be ignored.
```

The use of a Content-Type of multipart in a body part within another
multipart entity is explicitly allowed. In such cases, for obvious
reasons, care must be taken to ensure that each nested multipart
entity must use a different boundary delimiter. See Appendix C for an
example of nested multipart entities.

The use of the multipart Content-Type with only a single body part may be useful in certain contexts, and is explicitly permitted.

The only mandatory parameter for the multipart Content-Type is the boundary parameter, which consists of 1 to 70 characters from a set of characters known to be very robust through email gateways, and NOT ending with white space. (If a boundary appears to end with white space, the white space must be presumed to have been added by a

gateway, and must be deleted.) It is formally specified by the following BNF:

```
boundary := 0*69<bchars> bcharsnospace

bchars := bcharsnospace / " "

bcharsnospace := DIGIT / ALPHA / "'" / "(" / ")" / "+" /"_"
/ "," / "-" / "." / "/" / ":" / "=" / "?"
```

Overall, the body of a multipart entity may be specified as follows:

```
multipart-body := preamble 1*encapsulation
close-delimiter epilogue

encapsulation := delimiter body-part CRLF

delimiter := "--" boundary CRLF ; taken from Content-Type field.
; There must be no space
; between "--" and boundary.

close-delimiter := "--" boundary "--" CRLF ; Again, no space
by "--",

preamble := discard-text ; to be ignored upon receipt.

epilogue := discard-text ; to be ignored upon receipt.

discard-text := *(*text CRLF)

body-part := <"message" as defined in RFC 822,
with all header fields optional, and with the
specified delimiter not occurring anywhere in
the message body, either on a line by itself
or as a substring anywhere. Note that the
semantics of a part differ from the semantics
of a message, as described in the text.>
```

NOTE: In certain transport enclaves, RFC 822 restrictions such as the one that limits bodies to printable ASCII characters may not be in force. (That is, the transport domains may resemble standard Internet mail transport as specified in RFC821 and assumed by RFC822, but without certain restrictions.) The

relaxation of these restrictions should be construed as locally extending the definition of bodies, for example to include octets outside of the ASCII range, as long as these extensions are supported by the transport and adequately documented in the

Content-Transfer-Encoding header field. However, in no event are headers (either message headers or body-part headers) allowed to contain anything other than ASCII characters.

NOTE: Conspicuously missing from the multipart type is a notion of structured, related body parts. In general, it seems premature to try to standardize interpart structure yet. It is recommended that those wishing to provide a more structured or integrated multipart messaging facility should define a subtype of multipart that is syntactically identical, but that always expects the inclusion of a distinguished part that can be used to specify the structure and integration of the other parts, probably referring to them by their Content-ID field. If this approach is used, other implementations will not recognize the new subtype, but will treat it as the primary subtype (multipart/mixed) and will thus be able to show the user the parts that are recognized.

7.2.2. The Multipart/mixed (primary) subtype

The primary subtype for multipart, "mixed", is intended for use when the body parts are independent and need to be bundled in a particular order. Any multipart subtypes that an implementation does not recognize must be treated as being of subtype "mixed".

7.2.3. The Multipart/alternative subtype

The multipart/alternative type is syntactically identical to multipart/mixed, but the semantics are different. In particular, each of the parts is an "alternative" version of the same information.

Systems should recognize that the content of the various parts are interchangeable. Systems should choose the "best" type based on the local environment and preferences, in some cases even through user interaction. As with multipart/mixed, the order of body parts is significant. In this case, the alternatives appear in an order of increasing faithfulness to the original content. In general, the best choice is the LAST part of a type supported by the recipient system's local environment.

Multipart/alternative may be used, for example, to send mail in a fancy text format in such a way that it can easily be displayed anywhere:

```
From: Nathaniel Borenstein <nsb@bellcore.com>
To: Ned Freed <ned@innosoft.com>
Subject: Formatted text mail
MIME-Version: 1.0
Content-Type: multipart/alternative; boundary=boundary42

--boundary42

Content-Type: text/plain; charset=us-ascii

...plain text version of message goes here....
--boundary42
Content-Type: text/richtext

.... RFC 1341 richtext version of same message goes here ...
--boundary42
Content-Type: text/x-whatever

.... fanciest formatted version of same message goes here
...
--boundary42--
```

In this example, users whose mail system understood the "text/x-whatever" format would see only the fancy version, while other users would see only the richtext or plain text version, depending on the capabilities of their system.

In general, user agents that compose multipart/alternative entities must place the body parts in increasing order of preference, that is, with the preferred format last. For fancy text, the sending user agent should put the plainest format first and the richest format last. Receiving user agents should pick and display the last format they are capable of displaying. In the case where one of the alternatives is itself of type "multipart" and contains unrecognized sub-parts, the user agent may choose either to show that alternative, an earlier alternative, or both.

NOTE: From an implementor's perspective, it might seem more sensible to reverse this ordering, and have the plainest alternative last. However, placing the plainest alternative first is the friendliest possible option when multipart/alternative entities are viewed using a non-MIME-conformant mail reader. While this approach does impose some burden on conformant mail readers, interoperability with older mail readers was deemed to be more important in this case.

It may be the case that some user agents, if they can recognize more than one of the formats, will prefer to offer the user the choice of

RFC 1521 MIME September 1993

which format to view. This makes sense, for example, if mail includes both a nicely-formatted image version and an easily-edited text version. What is most critical, however, is that the user not automatically be shown multiple versions of the same data. Either the user should be shown the last recognized version or should be given the choice.

NOTE ON THE SEMANTICS OF CONTENT-ID IN MULTIPART/ALTERNATIVE: Each part of a multipart/alternative entity represents the same data, but the mappings between the two are not necessarily without information loss. For example, information is lost when translating ODA to PostScript or plain text. It is recommended that each part should have a different Content-ID value in the case where the information content of the two parts is not identical. However, where the information content is identical -- for example, where several parts of type "application/external- body" specify alternate ways to access the identical data -- the same Content-ID field value should be used, to optimize any cacheing mechanisms that might be present on the recipient's end. However, it is recommended that the Content-ID values used by the parts should not be the same Content-ID value that describes the multipart/alternative as a whole, if there is any such Content-ID field. That is, one Content-ID value will refer to the multipart/alternative entity, while one or more other Content-ID values will refer to the parts inside it.

7.2.4. The Multipart/digest subtype

This document defines a "digest" subtype of the multipart Content-Type. This type is syntactically identical to multipart/mixed, but the semantics are different. In particular, in a digest, the default Content-Type value for a body part is changed from "text/plain" to "message/rfc822". This is done to allow a more readable digest format that is largely compatible (except for the quoting convention) with RFC 934.

A digest in this format might, then, look something like this:

```
From: Moderator-Address
To: Recipient-List
MIME-Version: 1.0
Subject: Internet Digest, volume 42
Content-Type: multipart/digest;
boundary="---- next message ----"

------ next message ----

From: someone-else
Subject: my opinion

...body goes here ...
```

------ next message ----

From: someone-else-again
Subject: my different opinion

... another body goes here...

------ next message ------

7.2.5. The Multipart/parallel subtype

This document defines a "parallel" subtype of the multipart Content-Type. This type is syntactically identical to multipart/mixed, but the semantics are different. In particular, in a parallel entity, the order of body parts is not significant.

A common presentation of this type is to display all of the parts simultaneously on hardware and software that are capable of doing so. However, composing agents should be aware that many mail readers will lack this capability and will show the parts serially in any event.

7.2.6. Other Multipart subtypes

Other multipart subtypes are expected in the future. MIME implementations must in general treat unrecognized subtypes of multipart as being equivalent to "multipart/mixed".

The formal grammar for content-type header fields for multipart data is given by:

multipart-type := "multipart" "/" multipart-subtype
";" "boundary" "=" boundary

multipart-subtype := "mixed" / "parallel" / "digest"
/ "alternative" / extension-token

7.3. The Message Content-Type

It is frequently desirable, in sending mail, to encapsulate another mail message. For this common operation, a special Content-Type, "message", is defined. The primary subtype, message/rfc822, has no required parameters in the Content-Type field. Additional subtypes, "partial" and "External-body", do have required parameters. These subtypes are explained below.

NOTE: It has been suggested that subtypes of message might be defined for forwarded or rejected messages. However, forwarded and rejected messages can be handled as multipart messages in which the first part contains any control or descriptive information, and a second part, of type message/rfc822, is the forwarded or rejected message. Composing rejection and forwarding messages in this manner will preserve the type information on the

original message and allow it to be correctly presented to the recipient, and hence is strongly encouraged.

As stated in the definition of the Content-Transfer-Encoding field, no encoding other than "7bit", "8bit", or "binary" is permitted for messages or parts of type "message". Even stronger restrictions apply to the subtypes "message/partial" and "message/external-body", as specified below. The message header fields are always US-ASCII in any case, and data within the body can still be encoded, in which case the Content-Transfer-Encoding header field in the encapsulated message will reflect this. Non-ASCII text in the headers of an encapsulated message can be specified using the mechanisms described in [RFC-1522].

Mail gateways, relays, and other mail handling agents are commonly known to alter the top-level header of an RFC 822 message. In particular, they frequently add, remove, or reorder header fields. Such alterations are explicitly forbidden for the encapsulated headers embedded in the bodies of messages of type "message."

7.3.1. The Message/rfc822 (primary) subtype

A Content-Type of "message/rfc822" indicates that the body contains an encapsulated message, with the syntax of an RFC 822 message. However, unlike top-level RFC 822 messages, it is not required that each message/rfc822 body must include a "From", "Subject", and at least one destination header.

It should be noted that, despite the use of the numbers "822", a

message/rfc822 entity can include enhanced information as defined in this document. In other words, a message/rfc822 message may be a MIME message.

7.3.2. The Message/Partial subtype

A subtype of message, "partial", is defined in order to allow large objects to be delivered as several separate pieces of mail and automatically reassembled by the receiving user agent. (The concept is similar to IP fragmentation/reassembly in the basic Internet Protocols.) This mechanism can be used when intermediate transport agents limit the size of individual messages that can be sent. Content-Type "message/partial" thus indicates that the body contains a fragment of a larger message.

Three parameters must be specified in the Content-Type field of type message/partial: The first, "id", is a unique identifier, as close to a world-unique identifier as possible, to be used to match the parts together. (In general, the identifier is essentially a message-id; if placed in double quotes, it can be any message-id, in accordance

with the BNF for "parameter" given earlier in this specification.) The second, "number", an integer, is the part number, which indicates where this part fits into the sequence of fragments. The third, "total", another integer, is the total number of parts. This third subfield is required on the final part, and is optional (though encouraged) on the earlier parts. Note also that these parameters may be given in any order.

Thus, part 2 of a 3-part message may have either of the following header fields:

```
Content-Type: Message/Partial;
number=2; total=3;
id="oc=jpbe0M2Yt4s@thumper.bellcore.com"
```

```
Content-Type: Message/Partial;
id="oc=jpbe0M2Yt4s@thumper.bellcore.com";
number=2
```

But part 3 MUST specify the total number of parts:

```
Content-Type: Message/Partial;
number=3; total=3;
id="oc=jpbe0M2Yt4s@thumper.bellcore.com"
```

Note that part numbering begins with 1, not 0.

When the parts of a message broken up in this manner are put

together, the result is a complete MIME entity, which may have its own Content-Type header field, and thus may contain any other data type.

Message fragmentation and reassembly: The semantics of a reassembled partial message must be those of the "inner" message, rather than of a message containing the inner message. This makes it possible, for example, to send a large audio message as several partial messages, and still have it appear to the recipient as a simple audio message rather than as an encapsulated message containing an audio message. That is, the encapsulation of the message is considered to be "transparent".

When generating and reassembling the parts of a message/partial message, the headers of the encapsulated message must be merged with the headers of the enclosing entities. In this process the following rules must be observed:

(1) All of the header fields from the initial enclosing entity (part one), except those that start with "Content-" and the specific header fields "Message-ID", "Encrypted", and "MIME-

Version", must be copied, in order, to the new message.

(2) Only those header fields in the enclosed message which start with "Content-" and "Message-ID", "Encrypted", and "MIME-Version" must be appended, in order, to the header fields of the new message. Any header fields in the enclosed message which do not start with "Content-" (except for "Message-ID", "Encrypted", and "MIME-Version") will be ignored.

(3) All of the header fields from the second and any subsequent messages will be ignored.

For example, if an audio message is broken into two parts, the first part might look something like this:

```
X-Weird-Header-1: Foo
From: Bill@host.com
To: joe@otherhost.com
Subject: Audio mail
Message-ID: <id1@host.com>
MIME-Version: 1.0
Content-type: message/partial;
id="ABC@host.com";
number=1; total=2

X-Weird-Header-1: Bar
X-Weird-Header-2: Hello
```

```
Message-ID: <anotherid@foo.com>
MIME-Version: 1.0
Content-type: audio/basic
Content-transfer-encoding: base64

... first half of encoded audio data goes here...
```

and the second half might look something like this:

```
From: Bill@host.com
To: joe@otherhost.com
Subject: Audio mail
MIME-Version: 1.0
Message-ID: <id2@host.com>
Content-type: message/partial;
id="ABC@host.com"; number=2; total=2

... second half of encoded audio data goes here...
```

Then, when the fragmented message is reassembled, the resulting message to be displayed to the user should look something like this:

```
X-Weird-Header-1: Foo
From: Bill@host.com
To: joe@otherhost.com
Subject: Audio mail
Message-ID: <anotherid@foo.com>
MIME-Version: 1.0
Content-type: audio/basic
Content-transfer-encoding: base64

... first half of encoded audio data goes here...
... second half of encoded audio data goes here...
```

Note on encoding of MIME entities encapsulated inside message/partial entities: Because data of type "message" may never be encoded in base64 or quoted-printable, a problem might arise if message/partial entities are constructed in an environment that supports binary or 8-bit transport. The problem is that the binary data would be split into multiple message/partial objects, each of them requiring binary transport. If such objects were encountered at a gateway into a 7-bit transport environment, there would be no way to properly encode them for the 7-bit world, aside from waiting for all of the parts, reassembling the message, and then encoding the reassembled data in base64 or quoted-printable. Since it is possible that different parts might go through different gateways, even this is not an acceptable solution. For this reason, it is specified that MIME entities of type message/partial must always have a content-

transfer-encoding of 7-bit (the default). In particular, even in environments that support binary or 8-bit transport, the use of a content-transfer-encoding of "8bit" or "binary" is explicitly prohibited for entities of type message/partial.

It should be noted that, because some message transfer agents may choose to automatically fragment large messages, and because such agents may use different fragmentation thresholds, it is possible that the pieces of a partial message, upon reassembly, may prove themselves to comprise a partial message. This is explicitly permitted.

It should also be noted that the inclusion of a "References" field in the headers of the second and subsequent pieces of a fragmented message that references the Message-Id on the previous piece may be of benefit to mail readers that understand and track references. However, the generation of such "References" fields is entirely optional.

Finally, it should be noted that the "Encrypted" header field has been made obsolete by Privacy Enhanced Messaging (PEM), but the rules above are believed to describe the correct way to treat it if it is encountered in the context of conversion to and from message/partial

fragments.

7.3.3. The Message/External-Body subtype

The external-body subtype indicates that the actual body data are not included, but merely referenced. In this case, the parameters describe a mechanism for accessing the external data.

When an entity is of type "message/external-body", it consists of a header, two consecutive CRLFs, and the message header for the encapsulated message. If another pair of consecutive CRLFs appears, this of course ends the message header for the encapsulated message. However, since the encapsulated message's body is itself external, it does NOT appear in the area that follows. For example, consider the following message:

Content-type: message/external-body; access-
type=local-file;

name="/u/nsb/Me.gif"

Content-type: image/gif
Content-ID: <id42@guppylake.bellcore.com>
Content-Transfer-Encoding: binary

THIS IS NOT REALLY THE BODY!

The area at the end, which might be called the "phantom body", is ignored for most external-body messages. However, it may be used to contain auxiliary information for some such messages, as indeed it is when the access-type is "mail-server". Of the access-types defined by this document, the phantom body is used only when the access-type is "mail-server". In all other cases, the phantom body is ignored.

The only always-mandatory parameter for message/external-body is "access-type"; all of the other parameters may be mandatory or optional depending on the value of access-type.

ACCESS-TYPE -- A case-insensitive word, indicating the supported access mechanism by which the file or data may be obtained. Values include, but are not limited to, "FTP", "ANON-FTP", "TFTP", "AFS", "LOCAL-FILE", and "MAIL-SERVER". Future values, except for experimental values beginning with "X-" must be registered with IANA, as described in Appendix E .

In addition, the following three parameters are optional for ALL access-types:

EXPIRATION -- The date (in the RFC 822 "date-time" syntax, as extended by RFC 1123 to permit 4 digits in the year field) after which the existence of the external data is not guaranteed.

SIZE -- The size (in octets) of the data. The intent of this parameter is to help the recipient decide whether or not to expend the necessary resources to retrieve the external data. Note that this describes the size of the data in its canonical form, that is, before any Content- Transfer-Encoding has been applied or after the data have been decoded.

PERMISSION -- A case-insensitive field that indicates whether or not it is expected that clients might also attempt to overwrite the data. By default, or if permission is "read", the assumption is that they are not, and that if the data is retrieved once, it is never needed again. If PERMISSION is "read-write", this assumption is invalid, and any local copy must be considered no more than a cache. "Read" and "Read-write" are the only defined values of permission.

The precise semantics of the access-types defined here are described in the sections that follow.

The encapsulated headers in ALL message/external-body entities MUST include a Content-ID header field to give a unique identifier by

which to reference the data. This identifier may be used for cacheing mechanisms, and for recognizing the receipt of the data when the access-type is "mail-server".

Note that, as specified here, the tokens that describe external-body data, such as file names and mail server commands, are required to be in the US-ASCII character set. If this proves problematic in practice, a new mechanism may be required as a future extension to MIME, either as newly defined access-types for message/external-body or by some other mechanism.

As with message/partial, it is specified that MIME entities of type message/external-body must always have a content-transfer-encoding of 7-bit (the default). In particular, even in environments that support binary or 8-bit transport, the use of a content-transfer-encoding of "8bit" or "binary" is explicitly prohibited for entities of type message/external-body.

7.3.3.1. The "ftp" and "tftp" access-types

An access-type of FTP or TFTP indicates that the message body is accessible as a file using the FTP [RFC-959] or TFTP [RFC-783] protocols, respectively. For these access-types, the following additional parameters are mandatory:

NAME -- The name of the file that contains the actual body data.

SITE -- A machine from which the file may be obtained, using the given protocol. This must be a fully qualified domain name, not a

nickname.

Before any data are retrieved, using FTP, the user will generally need to be asked to provide a login id and a password for the machine named by the site parameter. For security reasons, such an id and password are not specified as content-type parameters, but must be obtained from the user.

In addition, the following parameters are optional:

DIRECTORY -- A directory from which the data named by NAME should be retrieved.

MODE -- A case-insensitive string indicating the mode to be used when retrieving the information. The legal values for access-type "TFTP" are "NETASCII", "OCTET", and "MAIL", as specified by the TFTP protocol [RFC-783]. The legal values for access-type "FTP" are "ASCII", "EBCDIC", "IMAGE", and "LOCALn" where "n" is a decimal integer, typically 8. These correspond to the

representation types "A" "E" "I" and "L n" as specified by the FTP protocol [RFC-959]. Note that "BINARY" and "TENEX" are not valid values for MODE, but that "OCTET" or "IMAGE" or "LOCAL8" should be used instead. IF MODE is not specified, the default value is "NETASCII" for TFTP and "ASCII" otherwise.

7.3.3.2. The "anon-ftp" access-type

The "anon-ftp" access-type is identical to the "ftp" access type, except that the user need not be asked to provide a name and password for the specified site. Instead, the ftp protocol will be used with login "anonymous" and a password that corresponds to the user's email address.

7.3.3.3. The "local-file" and "afs" access-types

An access-type of "local-file" indicates that the actual body is accessible as a file on the local machine. An access-type of "afs" indicates that the file is accessible via the global AFS file system. In both cases, only a single parameter is required:

NAME -- The name of the file that contains the actual body data.

The following optional parameter may be used to describe the locality of reference for the data, that is, the site or sites at which the file is expected to be visible:

SITE -- A domain specifier for a machine or set of machines that are known to have access to the data file. Asterisks may be used for wildcard matching to a part of a domain name, such as "*.bellcore.com", to indicate a set of machines on which the data

should be directly visible, while a single asterisk may be used to indicate a file that is expected to be universally available, e.g., via a global file system.

7.3.3.4. The "mail-server" access-type

The "mail-server" access-type indicates that the actual body is available from a mail server. The mandatory parameter for this access-type is:

SERVER -- The email address of the mail server from which the actual body data can be obtained.

Because mail servers accept a variety of syntaxes, some of which is multiline, the full command to be sent to a mail server is not included as a parameter on the content-type line. Instead, it is provided as the "phantom body" when the content-type is

message/external-body and the access- type is mail-server.

An optional parameter for this access-type is:

SUBJECT -- The subject that is to be used in the mail that is sent to obtain the data. Note that keying mail servers on Subject lines is NOT recommended, but such mail servers are known to exist.

Note that MIME does not define a mail server syntax. Rather, it allows the inclusion of arbitrary mail server commands in the phantom body. Implementations must include the phantom body in the body of the message it sends to the mail server address to retrieve the relevant data.

It is worth noting that, unlike other access-types, mail-server access is asynchronous and will happen at an unpredictable time in the future. For this reason, it is important that there be a mechanism by which the returned data can be matched up with the original message/external-body entity. MIME mailservers must use the same Content-ID field on the returned message that was used in the original message/external-body entity, to facilitate such matching.

7.3.3.5. Examples and Further Explanations

With the emerging possibility of very wide-area file systems, it becomes very hard to know in advance the set of machines where a file will and will not be accessible directly from the file system. Therefore it may make sense to provide both a file name, to be tried directly, and the name of one or more sites from which the file is known to be accessible. An implementation can try to retrieve remote files using FTP or any other protocol, using anonymous file retrieval or prompting the user for the necessary name and password. If an

external body is accessible via multiple mechanisms, the sender may include multiple parts of type message/external-body within an entity of type multipart/alternative.

However, the external-body mechanism is not intended to be limited to file retrieval, as shown by the mail-server access-type. Beyond this, one can imagine, for example, using a video server for external references to video clips.

If an entity is of type "message/external-body", then the body of the entity will contain the header fields of the encapsulated message. The body itself is to be found in the external location. This means that if the body of the "message/external-body" message contains two consecutive CRLFs, everything after those pairs is NOT part of the message itself. For most message/external-body messages, this trailing area must simply be ignored. However, it is a convenient

place for additional data that cannot be included in the content-type header field. In particular, if the "access-type" value is "mail-server", then the trailing area must contain commands to be sent to the mail server at the address given by the value of the SERVER parameter.

The embedded message header fields which appear in the body of the message/external-body data must be used to declare the Content-type of the external body if it is anything other than plain ASCII text, since the external body does not have a header section to declare its type. Similarly, any Content-transfer-encoding other than "7bit" must also be declared here. Thus a complete message/external-body message, referring to a document in PostScript format, might look like this:

```
From: Whomever
To: Someone
Subject: whatever
MIME-Version: 1.0
Message-ID: <id1@host.com>
Content-Type: multipart/alternative; boundary=42
Content-ID: <id001@guppylake.bellcore.com>

--42
Content-Type: message/external-body;
name="BodyFormats.ps";
site="thumper.bellcore.com";
access-type=ANON-FTP;
directory="pub";
mode="image";
expiration="Fri, 14 Jun 1991 19:13:14 -0400 (EDT)"
```

```
Content-type: application/postscript
Content-ID: <id42@guppylake.bellcore.com>

--42
Content-Type: message/external-body;
name="/u/nsb/writing/rfcs/RFC-MIME.ps";
site="thumper.bellcore.com";
access-type=AFS
expiration="Fri, 14 Jun 1991 19:13:14 -0400 (EDT)"

Content-type: application/postscript
Content-ID: <id42@guppylake.bellcore.com>

--42
Content-Type: message/external-body;
access-type=mail-server

Borenstein & Freed [Page 47]

RFC 1521 MIME September 1993

server="listserv@bogus.bitnet";
expiration="Fri, 14 Jun 1991 19:13:14 -0400 (EDT)"

Content-type: application/postscript
Content-ID: <id42@guppylake.bellcore.com>

get RFC-MIME.DOC

--42--
```

Note that in the above examples, the default Content-transfer-encoding of "7bit" is assumed for the external postscript data.

Like the message/partial type, the message/external-body type is intended to be transparent, that is, to convey the data type in the external body rather than to convey a message with a body of that type. Thus the headers on the outer and inner parts must be merged using the same rules as for message/partial. In particular, this means that the Content-type header is overridden, but the From and Subject headers are preserved.

Note that since the external bodies are not transported as mail, they need not conform to the 7-bit and line length requirements, but might in fact be binary files. Thus a Content-Transfer-Encoding is not generally necessary, though it is permitted.

Note that the body of a message of type "message/external-body" is governed by the basic syntax for an RFC 822 message. In particular, anything before the first consecutive pair of CRLFs is header information, while anything after it is body information, which is ignored for most access-types.

The formal grammar for content-type header fields for data of type message is given by:

```
message-type := "message" "/" message-subtype

message-subtype := "rfc822"
/ "partial" 2#3partial-param
/ "external-body" 1*external-param
/ extension-token

partial-param := (";" "id" "=" value)
/ (";" "number" "=" 1*DIGIT)
/ (";" "total" "=" 1*DIGIT)
; id & number required; total required for last part

external-param := (";" "access-type" "=" atype)
```

```
/ (";" "expiration" "=" date-time)
; Note that date-time is quoted
/ (";" "size" "=" 1*DIGIT)
/ (";" "permission" "=" ("read" / "read-write"))
; Permission is case-insensitive
/ (";" "name" "=" value)
/ (";" "site" "=" value)
/ (";" "dir" "=" value)
/ (";" "mode" "=" value)
/ (";" "server" "=" value)
/ (";" "subject" "=" value)
; access-type required;others required based on access-type

atype := "ftp" / "anon-ftp" / "tftp" / "local-file"
/ "afs" / "mail-server" / extension-token
; Case-insensitive
```

7.4. The Application Content-Type

The "application" Content-Type is to be used for data which do not fit in any of the other categories, and particularly for data to be processed by mail-based uses of application programs. This is information which must be processed by an application before it is viewable or usable to a user. Expected uses for Content-Type application include mail-based file transfer, spreadsheets, data for mail-based scheduling systems, and languages for "active" (computational) email. (The latter, in particular, can pose security problems which must be understood by implementors, and are considered in detail in the discussion of the application/PostScript content-type.)

For example, a meeting scheduler might define a standard representation for information about proposed meeting dates. An intelligent user agent would use this information to conduct a dialog with the user, and might then send further mail based on that dialog. More generally, there have been several "active" messaging languages

developed in which programs in a suitably specialized language are sent through the mail and automatically run in the recipient's environment.

Such applications may be defined as subtypes of the "application" Content-Type. This document defines two subtypes: octet-stream, and PostScript.

In general, the subtype of application will often be the name of the application for which the data are intended. This does not mean, however, that any application program name may be used freely as a subtype of application. Such usages (other than subtypes beginning

with "x-") must be registered with IANA, as described in Appendix E.

7.4.1. The Application/Octet-Stream (primary) subtype

The primary subtype of application, "octet-stream", may be used to indicate that a body contains binary data. The set of possible parameters includes, but is not limited to:

TYPE -- the general type or category of binary data. This is intended as information for the human recipient rather than for any automatic processing.

PADDING -- the number of bits of padding that were appended to the bit-stream comprising the actual contents to produce the enclosed byte-oriented data. This is useful for enclosing a bit-stream in a body when the total number of bits is not a multiple of the byte size.

An additional parameter, "conversions", was defined in [RFC-1341] but has been removed.

RFC 1341 also defined the use of a "NAME" parameter which gave a suggested file name to be used if the data were to be written to a file. This has been deprecated in anticipation of a separate Content-Disposition header field, to be defined in a subsequent RFC.

The recommended action for an implementation that receives application/octet-stream mail is to simply offer to put the data in a file, with any Content-Transfer-Encoding undone, or perhaps to use it as input to a user-specified process.

To reduce the danger of transmitting rogue programs through the mail, it is strongly recommended that implementations NOT implement a path-search mechanism whereby an arbitrary program named in the Content-Type parameter (e.g., an "interpreter=" parameter) is found and executed using the mail body as input.

7.4.2. The Application/PostScript subtype

A Content-Type of "application/postscript" indicates a PostScript program. Currently two variants of the PostScript language are allowed; the original level 1 variant is described in [POSTSCRIPT] and the more recent level 2 variant is described in [POSTSCRIPT2].

PostScript is a registered trademark of Adobe Systems, Inc. Use of the MIME content-type "application/postscript" implies recognition of that trademark and all the rights it entails.

The PostScript language definition provides facilities for internal labeling of the specific language features a given program uses. This labeling, called the PostScript document structuring conventions, is very general and provides substantially more information than just the language level.

The use of document structuring conventions, while not required, is strongly recommended as an aid to interoperability. Documents which lack proper structuring conventions cannot be tested to see whether or not they will work in a given environment. As such, some systems may assume the worst and refuse to process unstructured documents.

The execution of general-purpose PostScript interpreters entails serious security risks, and implementors are discouraged from simply sending PostScript email bodies to "off-the-shelf" interpreters. While it is usually safe to send PostScript to a printer, where the potential for harm is greatly constrained, implementors should consider all of the following before they add interactive display of PostScript bodies to their mail readers.

The remainder of this section outlines some, though probably not all, of the possible problems with sending PostScript through the mail.

Dangerous operations in the PostScript language include, but may not be limited to, the PostScript operators deletefile, renamefile, filenameforall, and file. File is only dangerous when applied to something other than standard input or output. Implementations may also define additional nonstandard file operators; these may also pose a threat to security. Filenameforall, the wildcard file search operator, may appear at first glance to be harmless. Note, however, that this operator has the potential to reveal information about what files the recipient has access to, and this information may itself be sensitive. Message senders should avoid the use of potentially dangerous file operators, since these operators are quite likely to be unavailable in secure PostScript implementations. Message-receiving and -displaying software should either completely disable all potentially dangerous file operators or take special care not to delegate any special authority to their operation. These operators should be viewed as being done by an outside agency when interpreting PostScript documents. Such disabling and/or checking should be done completely outside of the reach of the PostScript language itself;

care should be taken to insure that no method exists for re-enabling full-function versions of these operators.

The PostScript language provides facilities for exiting the normal interpreter, or server, loop. Changes made in this "outer" environment are customarily retained across documents, and may in some cases be retained semipermanently in nonvolatile memory. The

operators associated with exiting the interpreter loop have the potential to interfere with subsequent document processing. As such, their unrestrained use constitutes a threat of service denial. PostScript operators that exit the interpreter loop include, but may not be limited to, the exitserver and startjob operators. Message-sending software should not generate PostScript that depends on exiting the interpreter loop to operate. The ability to exit will probably be unavailable in secure PostScript implementations. Message-receiving and -displaying software should, if possible, disable the ability to make retained changes to the PostScript environment, and eliminate the startjob and exitserver commands. If these commands cannot be eliminated, the password associated with them should at least be set to a hard-to-guess value.

PostScript provides operators for setting system-wide and device-specific parameters. These parameter settings may be retained across jobs and may potentially pose a threat to the correct operation of the interpreter. The PostScript operators that set system and device parameters include, but may not be limited to, the setsystemparams and setdevparams operators. Message-sending software should not generate PostScript that depends on the setting of system or device parameters to operate correctly. The ability to set these parameters will probably be unavailable in secure PostScript implementations. Message-receiving and -displaying software should, if possible, disable the ability to change system and device parameters. If these operators cannot be disabled, the password associated with them should at least be set to a hard-to-guess value.

Some PostScript implementations provide nonstandard facilities for the direct loading and execution of machine code. Such facilities are quite obviously open to substantial abuse. Message-sending software should not make use of such features. Besides being totally hardware- specific, they are also likely to be unavailable in secure implementations of PostScript. Message-receiving and -displaying software should not allow such operators to be used if they exist.

PostScript is an extensible language, and many, if not most, implementations of it provide a number of their own extensions. This document does not deal with such extensions explicitly since they constitute an unknown factor. Message-sending software should not

make use of nonstandard extensions; they are likely to be missing from some implementations. Message-receiving and -displaying software should make sure that any nonstandard PostScript operators are secure and don't present any kind of threat.

It is possible to write PostScript that consumes huge amounts of various system resources. It is also possible to write PostScript programs that loop infinitely. Both types of programs have the

potential to cause damage if sent to unsuspecting recipients. Message-sending software should avoid the construction and dissemination of such programs, which is antisocial. Message-receiving and -displaying software should provide appropriate mechanisms to abort processing of a document after a reasonable amount of time has elapsed. In addition, PostScript interpreters should be limited to the consumption of only a reasonable amount of any given system resource.

Finally, bugs may exist in some PostScript interpreters which could possibly be exploited to gain unauthorized access to a recipient's system. Apart from noting this possibility, there is no specific action to take to prevent this, apart from the timely correction of such bugs if any are found.

7.4.3. Other Application subtypes

It is expected that many other subtypes of application will be defined in the future. MIME implementations must generally treat any unrecognized subtypes as being equivalent to application/octet-stream.

The formal grammar for content-type header fields for application data is given by:

```
application-type := "application" "/" application-subtype

application-subtype := ("octet-stream" *stream-param)
/ "postscript" / extension-token

stream-param := (";" "type" "=" value)
/ (";" "padding" "=" padding)

padding := "0" / "1" / "2" / "3" / "4" / "5" / "6" / "7"
```

7.5. The Image Content-Type

A Content-Type of "image" indicates that the body contains an image. The subtype names the specific image format. These names are case insensitive. Two initial subtypes are "jpeg" for the JPEG format, JFIF encoding, and "gif" for GIF format [GIF].

The list of image subtypes given here is neither exclusive nor exhaustive, and is expected to grow as more types are registered with IANA, as described in Appendix E.

The formal grammar for the content-type header field for data of type image is given by:

image-type := "image" "/" ("gif" / "jpeg" / extension-token)

7.6. The Audio Content-Type

A Content-Type of "audio" indicates that the body contains audio data. Although there is not yet a consensus on an "ideal" audio format for use with computers, there is a pressing need for a format capable of providing interoperable behavior.

The initial subtype of "basic" is specified to meet this requirement by providing an absolutely minimal lowest common denominator audio format. It is expected that richer formats for higher quality and/or lower bandwidth audio will be defined by a later document.

The content of the "audio/basic" subtype is audio encoded using 8-bit ISDN mu-law [PCM]. When this subtype is present, a sample rate of 8000 Hz and a single channel is assumed.

The formal grammar for the content-type header field for data of type audio is given by:

audio-type := "audio" "/" ("basic" / extension-token)

7.7. The Video Content-Type

A Content-Type of "video" indicates that the body contains a time-varying-picture image, possibly with color and coordinated sound. The term "video" is used extremely generically, rather than with reference to any particular technology or format, and is not meant to preclude subtypes such as animated drawings encoded compactly. The subtype "mpeg" refers to video coded according to the MPEG standard [MPEG].

Note that although in general this document strongly discourages the mixing of multiple media in a single body, it is recognized that many so-called "video" formats include a representation for synchronized audio, and this is explicitly permitted for subtypes of "video".

The formal grammar for the content-type header field for data of type video is given by:

video-type := "video" "/" ("mpeg" / extension-token)

7.8. Experimental Content-Type Values

A Content-Type value beginning with the characters "X-" is a private value, to be used by consenting mail systems by mutual agreement. Any format without a rigorous and public definition must be named

with an "X-" prefix, and publicly specified values shall never begin with "X-". (Older versions of the widely-used Andrew system use the "X-BE2" name, so new systems should probably choose a different name.)

In general, the use of "X-" top-level types is strongly discouraged. Implementors should invent subtypes of the existing types whenever possible. The invention of new types is intended to be restricted primarily to the development of new media types for email, such as digital odors or holography, and not for new data formats in general. In many cases, a subtype of application will be more appropriate than a new top-level type.

8. Summary

Using the MIME-Version, Content-Type, and Content-Transfer-Encoding header fields, it is possible to include, in a standardized way, arbitrary types of data objects with RFC 822 conformant mail messages. No restrictions imposed by either RFC 821 or RFC 822 are violated, and care has been taken to avoid problems caused by additional restrictions imposed by the characteristics of some Internet mail transport mechanisms (see Appendix B). The "multipart" and "message" Content-Types allow mixing and hierarchical structuring of objects of different types in a single message. Further Content-Types provide a standardized mechanism for tagging messages or body parts as audio, image, or several other kinds of data. A distinguished parameter syntax allows further specification of data format details, particularly the specification of alternate character sets. Additional optional header fields provide mechanisms for certain extensions deemed desirable by many implementors. Finally, a number of useful Content-Types are defined for general use by consenting user agents, notably message/partial, and message/external-body.

9. Security Considerations

Security issues are discussed in Section 7.4.2 and in Appendix F. Implementors should pay special attention to the security implications of any mail content-types that can cause the remote execution of any actions in the recipient's environment. In such cases, the discussion of the application/postscript content-type in Section 7.4.2 may serve as a model for considering other content-

types with remote execution capabilities.

Appendix A -- Minimal MIME-Conformance

The mechanisms described in this document are open-ended. It is definitely not expected that all implementations will support all of the Content-Types described, nor that they will all share the same extensions. In order to promote interoperability, however, it is useful to define the concept of "MIME-conformance" to define a certain level of implementation that allows the useful interworking of messages with content that differs from US ASCII text. In this section, we specify the requirements for such conformance.

A mail user agent that is MIME-conformant MUST:

1. Always generate a "MIME-Version: 1.0" header field.

2. Recognize the Content-Transfer-Encoding header field, and decode all received data encoded with either the quoted-printable or base64 implementations. Encode any data sent that is not in seven-bit mail-ready representation using one of these transformations and include the appropriate Content-Transfer-Encoding header field, unless the underlying transport mechanism supports non-seven-bit data, as SMTP does not.

3. Recognize and interpret the Content-Type header field, and avoid showing users raw data with a Content-Type field other than text. Be able to send at least text/plain messages, with the character set specified as a parameter if it is not US-ASCII.

4. Explicitly handle the following Content-Type values, to at least the following extents:

Text:

-- Recognize and display "text" mail
with the character set "US-ASCII."

-- Recognize other character sets at
least to the extent of being able
to inform the user about what
character set the message uses.

-- Recognize the "ISO-8859-*" character
sets to the extent of being able to
display those characters that are
common to ISO-8859-* and US-ASCII,
namely all characters represented
by octet values 0-127.

-- For unrecognized subtypes, show or
offer to show the user the "raw"
version of the data after
conversion of the content from
canonical form to local form.

Message:

-- Recognize and display at least the
primary (822) encapsulation.

Multipart:

-- Recognize the primary (mixed)
subtype. Display all relevant
information on the message level
and the body part header level and
then display or offer to display
each of the body parts individually.

-- Recognize the "alternative" subtype,
and avoid showing the user
redundant parts of
multipart/alternative mail.

-- Treat any unrecognized subtypes as if
they were "mixed".

Application:

-- Offer the ability to remove either of
the two types of Content-Transfer-
Encoding defined in this document
and put the resulting information
in a user file.

5. Upon encountering any unrecognized Content- Type, an implementation must treat it as if it had a Content-Type of "application/octet-stream" with no parameter sub-arguments. How such data are handled is up to an implementation, but likely options for handling such unrecognized data include offering the user to write it into a file (decoded from its mail transport format) or offering the user to name a program to which the decoded data should be passed as input. Unrecognized predefined types, which in a MIME-conformant mailer might still include audio, image, or video, should also be treated in this way.

A user agent that meets the above conditions is said to be MIME-

conformant. The meaning of this phrase is that it is assumed to be "safe" to send virtually any kind of properly-marked data to users of such mail systems, because such systems will at least be able to treat the data as undifferentiated binary, and will not simply splash it onto the screen of unsuspecting users. There is another sense in which it is always "safe" to send data in a format that is MIME-conformant, which is that such data will not break or be broken by any known systems that are conformant with RFC 821 and RFC 822. User agents that are MIME-conformant have the additional guarantee that the user will not be shown data that were never intended to be viewed as text.

Appendix B -- General Guidelines For Sending Email Data

Internet email is not a perfect, homogeneous system. Mail may become corrupted at several stages in its travel to a final destination. Specifically, email sent throughout the Internet may travel across many networking technologies. Many networking and mail technologies do not support the full functionality possible in the SMTP transport environment. Mail traversing these systems is likely to be modified in such a way that it can be transported.

There exist many widely-deployed non-conformant MTAs in the Internet. These MTAs, speaking the SMTP protocol, alter messages on the fly to take advantage of the internal data structure of the hosts they are implemented on, or are just plain broken.

The following guidelines may be useful to anyone devising a data format (Content-Type) that will survive the widest range of networking technologies and known broken MTAs unscathed. Note that anything encoded in the base64 encoding will satisfy these rules, but that some well-known mechanisms, notably the UNIX uuencode facility, will not. Note also that anything encoded in the Quoted-Printable

encoding will survive most gateways intact, but possibly not some gateways to systems that use the EBCDIC character set.

(1) Under some circumstances the encoding used for data may change as part of normal gateway or user agent operation. In particular, conversion from base64 to quoted-printable and vice versa may be necessary. This may result in the confusion of CRLF sequences with line breaks in text bodies. As such, the persistence of CRLF as something other than a line break must not be relied on.

(2) Many systems may elect to represent and store text data using local newline conventions. Local newline conventions may not match the RFC822 CRLF convention -- systems are known that use plain CR, plain LF, CRLF, or counted records. The result is that isolated CR and LF characters are not well tolerated in general; they may be lost or converted to delimiters on some systems, and hence must not be relied on.

(3) TAB (HT) characters may be misinterpreted or may be automatically converted to variable numbers of spaces. This is unavoidable in some environments, notably those not based on the ASCII character set. Such conversion is STRONGLY DISCOURAGED, but it may occur, and mail formats must not rely on the persistence of TAB (HT) characters.

(4) Lines longer than 76 characters may be wrapped or truncated in some environments. Line wrapping and line truncation are STRONGLY

DISCOURAGED, but unavoidable in some cases. Applications which require long lines must somehow differentiate between soft and hard line breaks. (A simple way to do this is to use the quoted-printable encoding.)

(5) Trailing "white space" characters (SPACE, TAB (HT)) on a line may be discarded by some transport agents, while other transport agents may pad lines with these characters so that all lines in a mail file are of equal length. The persistence of trailing white space, therefore, must not be relied on.

(6) Many mail domains use variations on the ASCII character set, or use character sets such as EBCDIC which contain most but not all of the US-ASCII characters. The correct translation of characters not in the "invariant" set cannot be depended on across character converting gateways. For example, this situation is a problem when sending uuencoded information across BITNET, an EBCDIC system. Similar problems can occur without crossing a gateway, since many Internet hosts use character sets other than ASCII internally. The definition of Printable Strings in X.400 adds further restrictions in certain special cases. In

particular, the only characters that are known to be consistent across all gateways are the 73 characters that correspond to the upper and lower case letters A-Z and a-z, the 10 digits 0-9, and the following eleven special characters:

"'" (ASCII code 39)
"(" (ASCII code 40)
")" (ASCII code 41)
"+" (ASCII code 43)
"," (ASCII code 44)
"-" (ASCII code 45)
"." (ASCII code 46)
"/" (ASCII code 47)
":" (ASCII code 58)
"=" (ASCII code 61)
"?" (ASCII code 63)

A maximally portable mail representation, such as the base64 encoding, will confine itself to relatively short lines of text in which the only meaningful characters are taken from this set of 73 characters.

(7) Some mail transport agents will corrupt data that includes certain literal strings. In particular, a period (".") alone on a line is known to be corrupted by some (incorrect) SMTP implementations, and a line that starts with the five characters "From " (the fifth character is a SPACE) are commonly corrupted as

well. A careful composition agent can prevent these corruptions by encoding the data (e.g., in the quoted-printable encoding, "=46rom " in place of "From " at the start of a line, and "=2E" in place of "." alone on a line.

Please note that the above list is NOT a list of recommended practices for MTAs. RFC 821 MTAs are prohibited from altering the character of white space or wrapping long lines. These BAD and illegal practices are known to occur on established networks, and implementations should be robust in dealing with the bad effects they can cause.

Appendix C -- A Complex Multipart Example

What follows is the outline of a complex multipart message. This message has five parts to be displayed serially: two introductory plain text parts, an embedded multipart message, a richtext part, and a closing encapsulated text message in a non-ASCII character set.

The embedded multipart message has two parts to be displayed in
parallel, a picture and an audio fragment.

MIME-Version: 1.0
From: Nathaniel Borenstein <nsb@bellcore.com>
To: Ned Freed <ned@innosoft.com>
Subject: A multipart example
Content-Type: multipart/mixed;
boundary=unique-boundary-1

This is the preamble area of a multipart message.
Mail readers that understand multipart format
should ignore this preamble.
If you are reading this text, you might want to
consider changing to a mail reader that understands
how to properly display multipart messages.
--unique-boundary-1

...Some text appears here...
[Note that the preceding blank line means
no header fields were given and this is text,
with charset US ASCII. It could have been
done with explicit typing as in the next part.]

--unique-boundary-1
Content-type: text/plain; charset=US-ASCII

This could have been part of the previous part,
but illustrates explicit versus implicit
typing of body parts.

--unique-boundary-1

Content-Type: Text/plain; charset=ISO-8859-1
Content-Transfer-Encoding: Quoted-printable

... Additional text in ISO-8859-1 goes here ...

--unique-boundary-1--
```

Appendix D -- Collected Grammar

This appendix contains the complete BNF grammar for all the syntax specified by this document.

By itself, however, this grammar is incomplete. It refers to several entities that are defined by RFC 822. Rather than reproduce those definitions here, and risk unintentional differences between the two, this document simply refers the reader to RFC 822 for the remaining definitions. Wherever a term is undefined, it refers to the RFC 822 definition.

```
application-subtype := ("octet-stream" *stream-param)
/ "postscript" / extension-token

application-type := "application" "/" application-subtype

attribute := token ; case-insensitive

atype := "ftp" / "anon-ftp" / "tftp" / "local-file"
/ "afs" / "mail-server" / extension-token
; Case-insensitive

audio-type := "audio" "/" ("basic" / extension-token)

body-part := <"message" as defined in RFC 822,
with all header fields optional, and with the
specified delimiter not occurring anywhere in
the message body, either on a line by itself
or as a substring anywhere.>
```

NOTE: In certain transport enclaves, RFC 822 restrictions such as the one that limits bodies to printable ASCII characters may not be in force. (That is, the transport domains may resemble standard Internet mail transport as specified in RFC821 and assumed by RFC822, but without certain restrictions.) The relaxation of these restrictions should be construed as locally extending the definition of bodies, for example to include octets outside of the ASCII range, as long as these extensions are supported by the transport and adequately documented in the Content-Transfer-Encoding header field. However, in no event are headers (either message headers or body-part headers) allowed to contain anything other than ASCII characters.

```

Appendix E -- IANA Registration Procedures

MIME has been carefully designed to have extensible mechanisms, and it is expected that the set of content-type/subtype pairs and their associated parameters will grow significantly with time. Several

other MIME fields, notably character set names, access-type parameters for the message/external-body type, and possibly even Content-Transfer-Encoding values, are likely to have new values defined over time. In order to ensure that the set of such values is developed in an orderly, well-specified, and public manner, MIME defines a registration process which uses the Internet Assigned Numbers Authority (IANA) as a central registry for such values.

In general, parameters in the content-type header field are used to convey supplemental information for various content types, and their use is defined when the content-type and subtype are defined. New parameters should not be defined as a way to introduce new functionality.

In order to simplify and standardize the registration process, this appendix gives templates for the registration of new values with IANA. Each of these is given in the form of an email message template, to be filled in by the registering party.

E.1 Registration of New Content-type/subtype Values

Note that MIME is generally expected to be extended by subtypes. If a new fundamental top-level type is needed, its specification must be published as an RFC or submitted in a form suitable to become an RFC, and be subject to the Internet standards process.

To: IANA@isi.edu
Subject: Registration of new MIME
content-type/subtype

MIME type name:

(If the above is not an existing top-level MIME type,
please explain why an existing type cannot be used.)

MIME subtype name:

Required parameters:

Optional parameters:

Encoding considerations:

Security considerations:

Published specification:

(The published specification must be an Internet RFC or
RFC-to-be if a new top-level type is being defined, and
must be a publicly available specification in any
case.)

Appendix F -- Summary of the Seven Content-types

Content-type: text

Subtypes defined by this document: plain

Important Parameters: charset

Encoding notes: quoted-printable generally preferred if an encoding
is needed and the character set is mostly an ASCII superset.

Security considerations: Rich text formats such as TeX and Troff
often contain mechanisms for executing arbitrary commands or file
system operations, and should not be used automatically unless
these security problems have been addressed. Even plain text may
contain control characters that can be used to exploit the
capabilities of "intelligent" terminals and cause security
violations. User interfaces designed to run on such terminals
should be aware of and try to prevent such problems.

Content-type: multipart

Subtypes defined by this document: mixed, alternative,
digest, parallel.

Important Parameters: boundary

Encoding notes: No content-transfer-encoding is permitted.

Content-type: message

Subtypes defined by this document: rfc822, partial, external-body

Important Parameters: id, number, total, access-type, expiration, size, permission, name, site, directory, mode, server, subject

Encoding notes: No content-transfer-encoding is permitted. Specifically, only "7bit" is permitted for "message/partial" or "message/external-body", and only "7bit", "8bit", or "binary" are permitted for other subtypes of "message".

Content-type: application

Subtypes defined by this document: octet-stream, postscript

Important Parameters: type, padding

Deprecated Parameters: name and conversions were defined in RFC 1341.

Encoding notes: base64 preferred for unreadable subtypes.

Security considerations: This type is intended for the transmission of data to be interpreted by locally-installed programs. If used, for example, to transmit executable binary programs or programs in general-purpose interpreted languages, such as LISP programs or shell scripts, severe security problems could result. Authors of mail-reading agents are cautioned against giving their systems the power to execute mail-based application data without carefully considering the security implications. While it is certainly possible to define safe application formats and even safe interpreters for unsafe formats, each interpreter should be evaluated separately for possible security problems.

Content-type: image

Subtypes defined by this document: jpeg, gif

Important Parameters: none

Encoding notes: base64 generally preferred

Content-type: audio

Subtypes defined by this document: basic

Important Parameters: none

Encoding notes: base64 generally preferred

Content-type: video

Subtypes defined by this document: mpeg

Important Parameters: none

Encoding notes: base64 generally preferred

Appendix G -- Canonical Encoding Model

There was some confusion, in earlier drafts of this memo, regarding the model for when email data was to be converted to canonical form and encoded, and in particular how this process would affect the treatment of CRLFs, given that the representation of newlines varies greatly from system to system. For this reason, a canonical model for encoding is presented below.

The process of composing a MIME entity can be modeled as being done in a number of steps. Note that these steps are roughly similar to those steps used in RFC 1421 and are performed for each 'innermost level' body:

Step 1. Creation of local form.

The body to be transmitted is created in the system's native format. The native character set is used, and where appropriate local end of line conventions are used as well. The body may be a UNIX-style text file, or a Sun raster image, or a VMS indexed file, or audio data in a system-dependent format stored only in memory, or anything else that corresponds to the local model for the representation of some form of information. Fundamentally, the data is created in the "native" form specified by the type/subtype information.

Step 2. Conversion to canonical form.

The entire body, including "out-of-band" information such as record lengths and possibly file attribute information, is converted to a universal canonical form. The specific content type of the body as well as its associated attributes dictate the nature of the canonical form that is used. Conversion to the proper canonical form may involve character set conversion, transformation of audio data, compression, or various other operations specific to the various content types. If character set conversion is involved, however, care must be taken to understand the semantics of the content-type, which may have strong implications for any character set conversion, e.g. with regard to syntactically meaningful characters in a text subtype other than "plain".

For example, in the case of text/plain data, the text must be converted to a supported character set and lines must be delimited with CRLF delimiters in accordance with RFC822. Note that the restriction on line lengths implied by RFC822 is eliminated if the next step employs either quoted-printable or base64 encoding.

Step 3. Apply transfer encoding.

A Content-Transfer-Encoding appropriate for this body is applied. Note that there is no fixed relationship between the content type and the transfer encoding. In particular, it may be appropriate to base the choice of base64 or quoted-printable on character frequency counts which are specific to a given instance of a body.

Step 4. Insertion into entity.

The encoded object is inserted into a MIME entity with appropriate headers. The entity is then inserted into the body of a higher-level entity (message or multipart) if needed.

It is vital to note that these steps are only a model; they are specifically NOT a blueprint for how an actual system would be built. In particular, the model fails to account for two common designs:

1. In many cases the conversion to a canonical form prior to encoding will be subsumed into the encoder itself, which understands local formats directly. For example, the local newline convention for text bodies might be carried through to the encoder itself along with knowledge of what that format is.

2. The output of the encoders may have to pass through one or more additional steps prior to being transmitted as a message. As such, the output of the encoder may not be conformant with the formats specified by RFC822. In particular, once again it may be appropriate for the converter's output to be expressed using local newline conventions rather than using the standard RFC822 CRLF delimiters.

Other implementation variations are conceivable as well. The vital aspect of this discussion is that, in spite of any optimizations, collapsings of required steps, or insertion of additional processing, the resulting messages must be consistent with those produced by the model described here. For example, a message with the following header fields:

```
Content-type: text/foo; charset=bar
Content-Transfer-Encoding: base64
```

must be first represented in the text/foo form, then (if necessary) represented in the "bar" character set, and finally transformed via the base64 algorithm into a mail-safe form.

Appendix H -- Changes from RFC 1341

This document is a relatively minor revision of RFC 1341. For the convenience of those familiar with RFC 1341, the technical changes from that document are summarized in this appendix.

1. The definition of "tspecials" has been changed to no longer include ".".

2. The Content-ID field is now mandatory for message/external-body parts.

3. The text/richtext type (including the old Section 7.1.3 and Appendix D) has been moved to a separate document.

4. The rules on header merging for message/partial data have been changed to treat the Encrypted and MIME-Version headers as special cases.

5. The definition of the external-body access-type parameter has been changed so that it can only indicate a single access method (which was all that made sense).

6. There is a new "Subject" parameter for message/external-body, access-type mail-server, to permit MIME-based use of mail servers that rely on Subject field information.

7. The "conversions" parameter for application/octet-stream has been removed.

8. Section 7.4.1 now deprecates the use of the "name" parameter for application/octet-stream, as this will be superseded in the future by a Content-Disposition header.

9. The formal grammar for multipart bodies has been changed so that a CRLF is no longer required before the first boundary line.

10. MIME entities of type "message/partial" and "message/external-body" are now required to use only the "7bit" transfer-encoding. (Specifically, "binary" and "8bit" are not permitted.)

11. The "application/oda" content-type has been removed.

12. A note has been added to the end of section 7.2.3, explaining the semantics of Content-ID in a multipart/alternative MIME entity.

13. The formal syntax for the "MIME-Version" field has been tightened, but in a way that is completely compatible with the only

version number defined in RFC 1341.

14. In Section 7.3.1, the definition of message/rfc822 has been relaxed regarding mandatory fields.

All other changes from RFC 1341 were editorial changes and do not affect the technical content of MIME. Considerable formal grammar has been added, but this reflects the prose specification that was already in place.
